Lecture 4

Machine Language

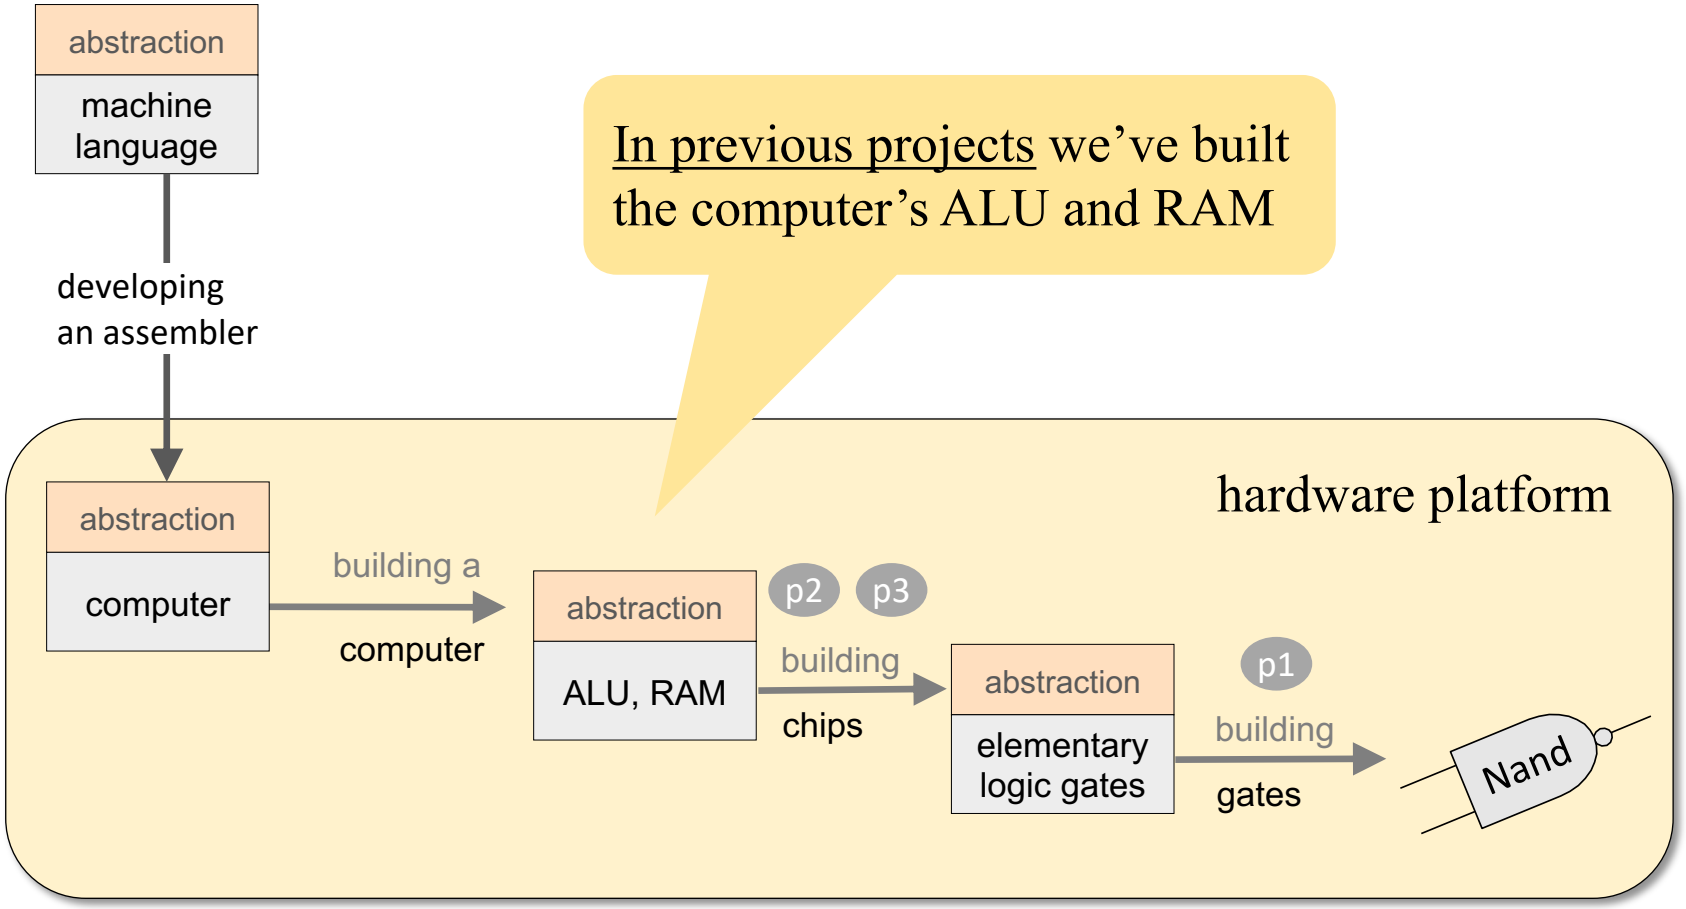
These slides support chapter 4 of the book

The Elements of Computing Systems

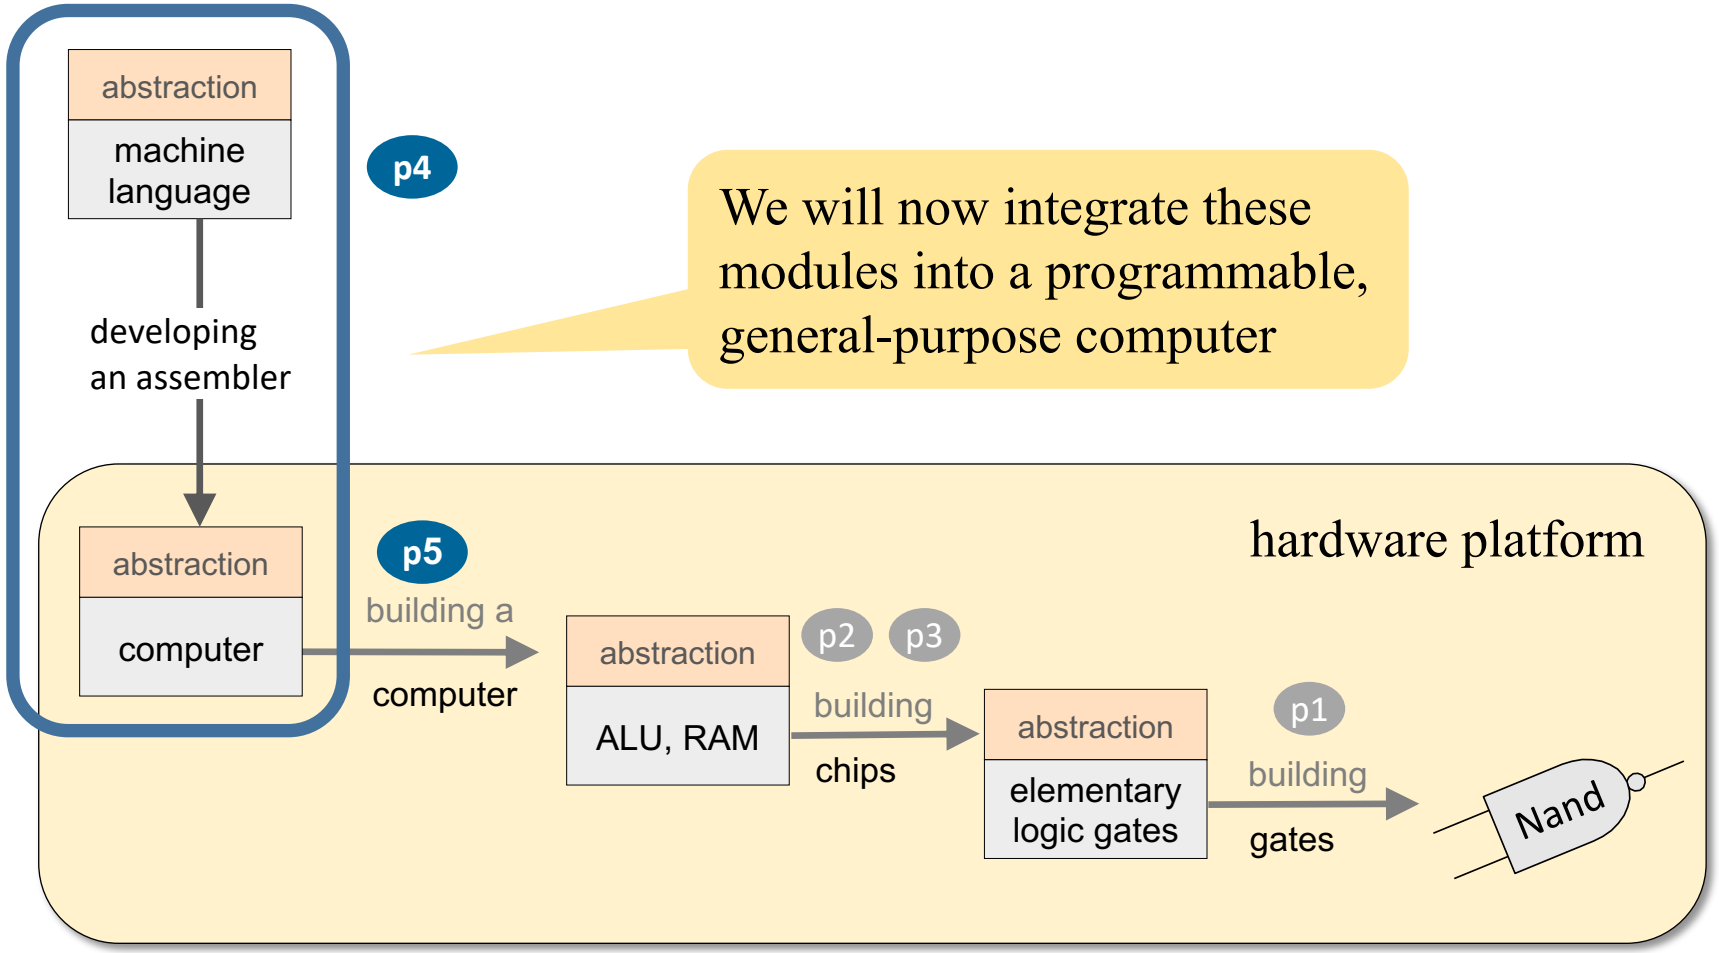
By Noam Nisan and Shimon Schocken

MIT Press, 2021

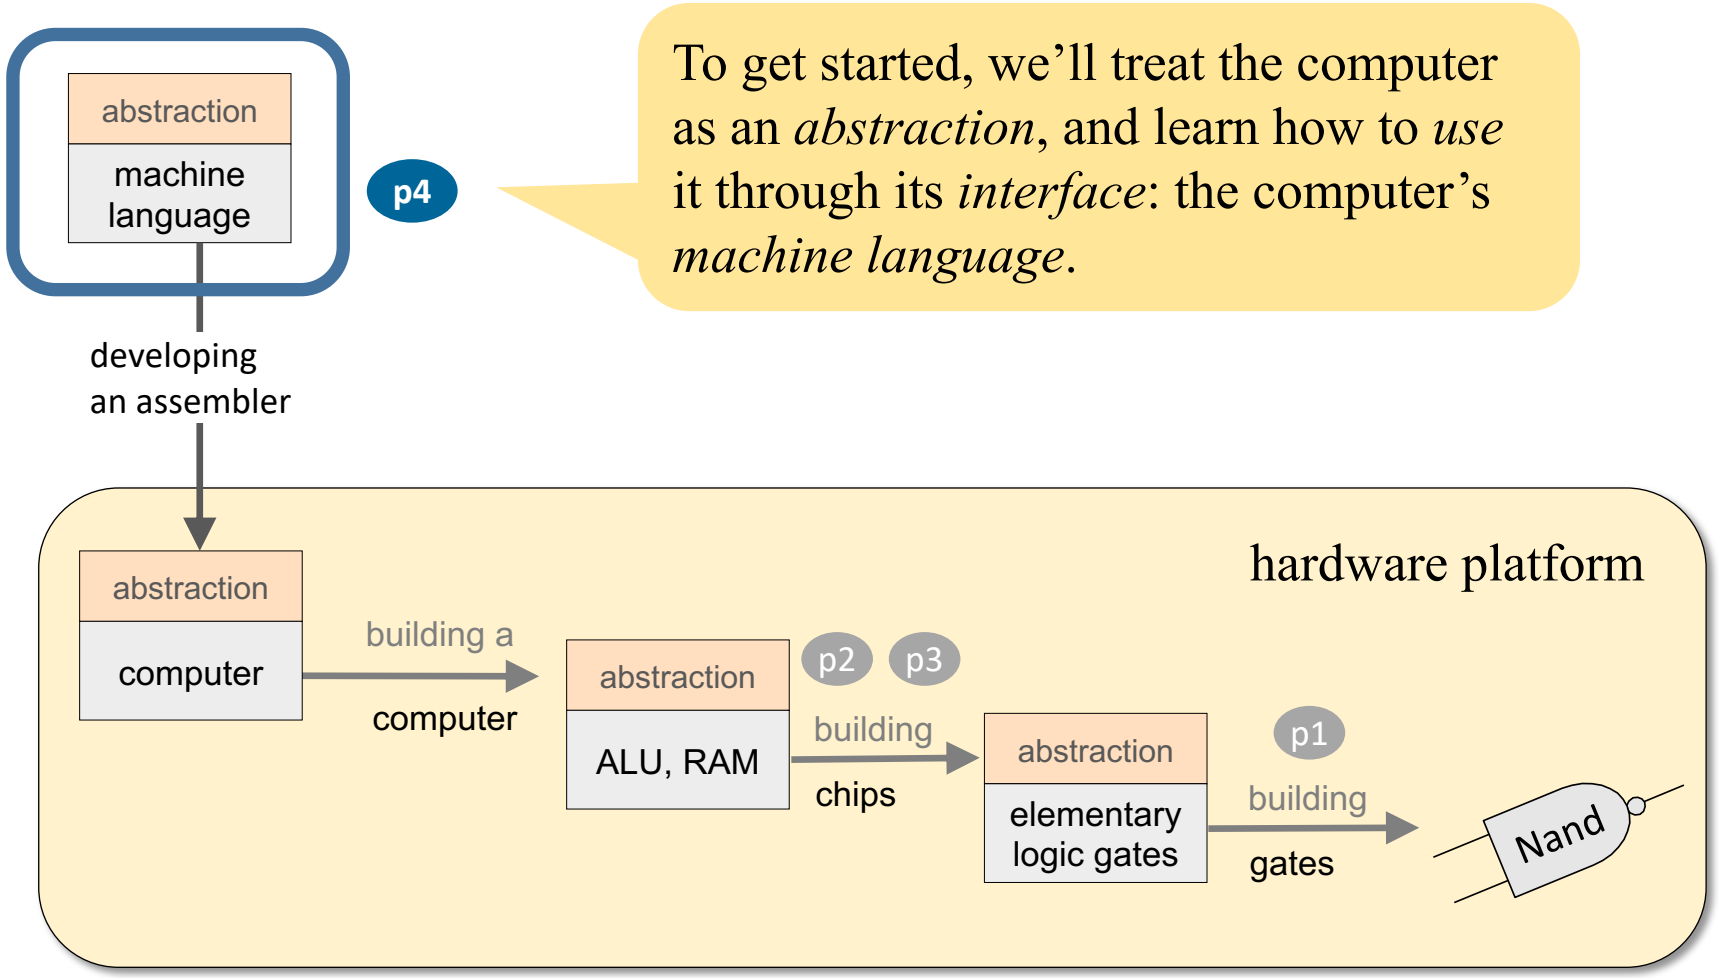
Nand to Tetris Roadmap: Hardware



Nand to Tetris Roadmap: Hardware



Nand to Tetris Roadmap: Hardware



Computer systems are flexible and versatile

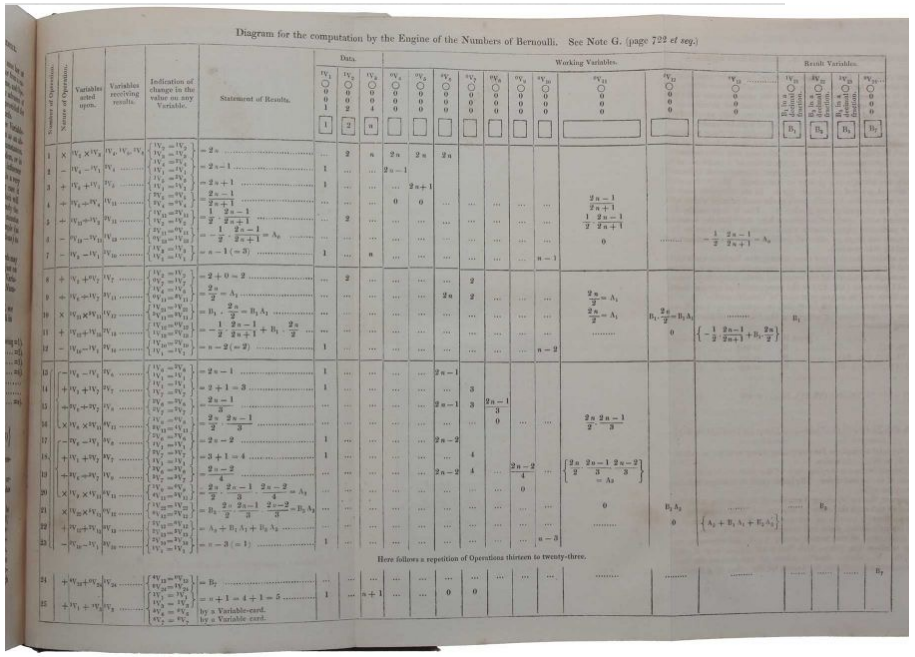
Same **hardware** can run many different programs (**software**)

Computer systems are flexible and versatile

Same **hardware** can run many different programs (**software**)

Ada Lovelace

(1843)

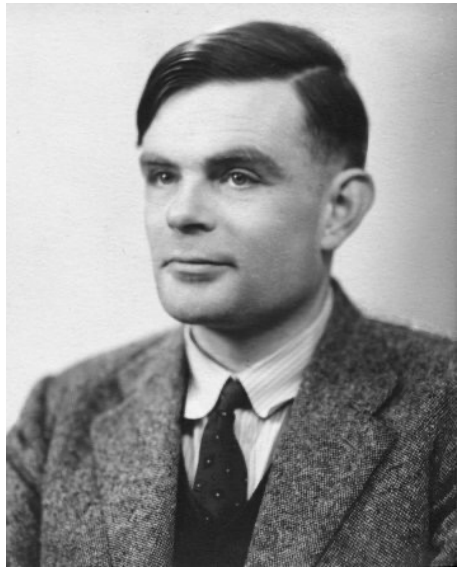


Early symbolic program

Landmark “proof of concept” that computers can be programmed

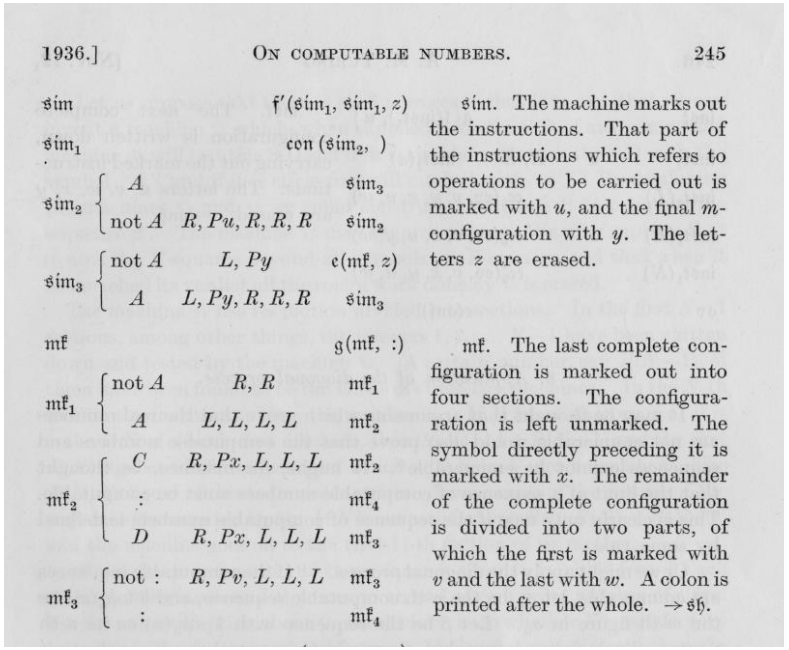
Computer systems are flexible and versatile

Same **hardware** can run many different programs (**software**)



Alan Turing

(1936)



1936.] ON COMPUTABLE NUMBERS. 245

$\mathfrak{sim}$ $\quad \mathfrak{f}'(\mathfrak{sim}_1, \mathfrak{sim}_1, z)$

$\mathfrak{sim}_1$ $\quad \mathrm{con}(\mathfrak{sim}_2,)$

$\mathfrak{sim}_2$ { A $\quad \mathfrak{sim}_3$; not A $\quad R, Pu, R, R, R$ $\quad \mathfrak{sim}_2$

$\mathfrak{sim}_3$ { not A $\quad L, Py$ $\quad \mathfrak{c}(\mathfrak{mf}, z)$; A $\quad L, Py, R, R, R$ $\quad \mathfrak{sim}_3$

$\mathfrak{sim}$. The machine marks out the instructions. That part of the instructions which refers to operations to be carried out is marked with u, and the final m-configuration with y. The letters z are erased.

$\mathfrak{mf}$ $\quad \mathfrak{g}(\mathfrak{mf}, :)$

$\mathfrak{mf}_1$ { not A $\quad R, R$ $\quad \mathfrak{mf}_1$; A $\quad L, L, L, L$ $\quad \mathfrak{mf}_2$

$\mathfrak{mf}_2$ { C $\quad R, Px, L, L, L$ $\quad \mathfrak{mf}_2$; $:$ $\quad \mathfrak{mf}_4$; D $\quad R, Px, L, L, L$ $\quad \mathfrak{mf}_3$

$\mathfrak{mf}_3$ { not $:$ $\quad R, Pv, L, L, L$ $\quad \mathfrak{mf}_3$; $:$ $\quad \mathfrak{mf}_4$

$\mathfrak{mf}$. The last complete configuration is marked out into four sections. The configuration is left unmarked. The symbol directly preceding it is marked with x. The remainder of the complete configuration is divided into two parts, of which the first is marked with v and the last with w. A colon is printed after the whole. $\rightarrow \mathfrak{sh}$.

Universal Turing Machine

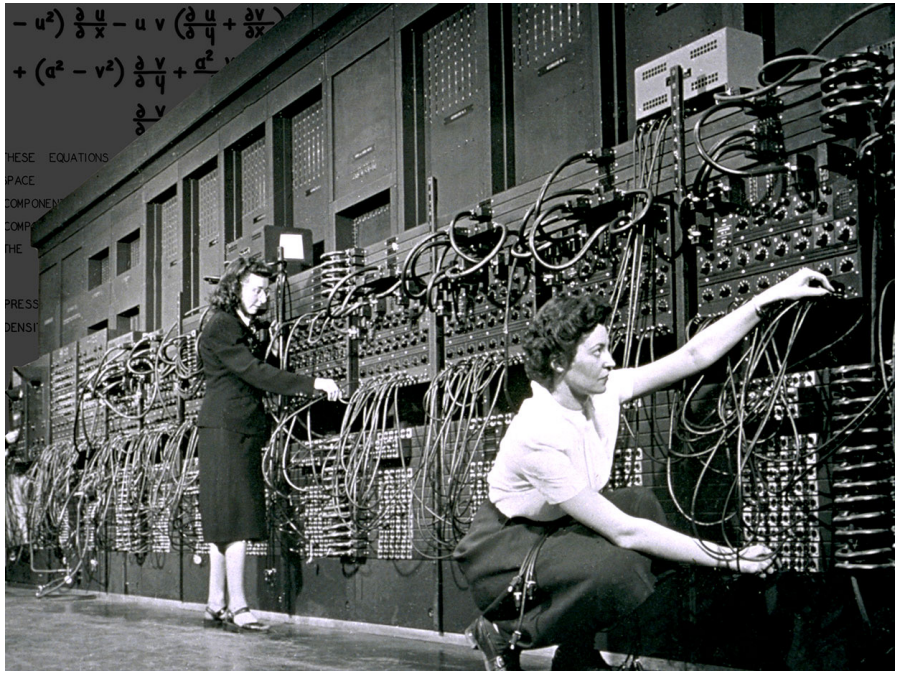
Landmark paper, describing a theoretical general-purpose computer

Computer systems are flexible and versatile

Same **hardware** can run many different programs (**software**)

John Von Neumann

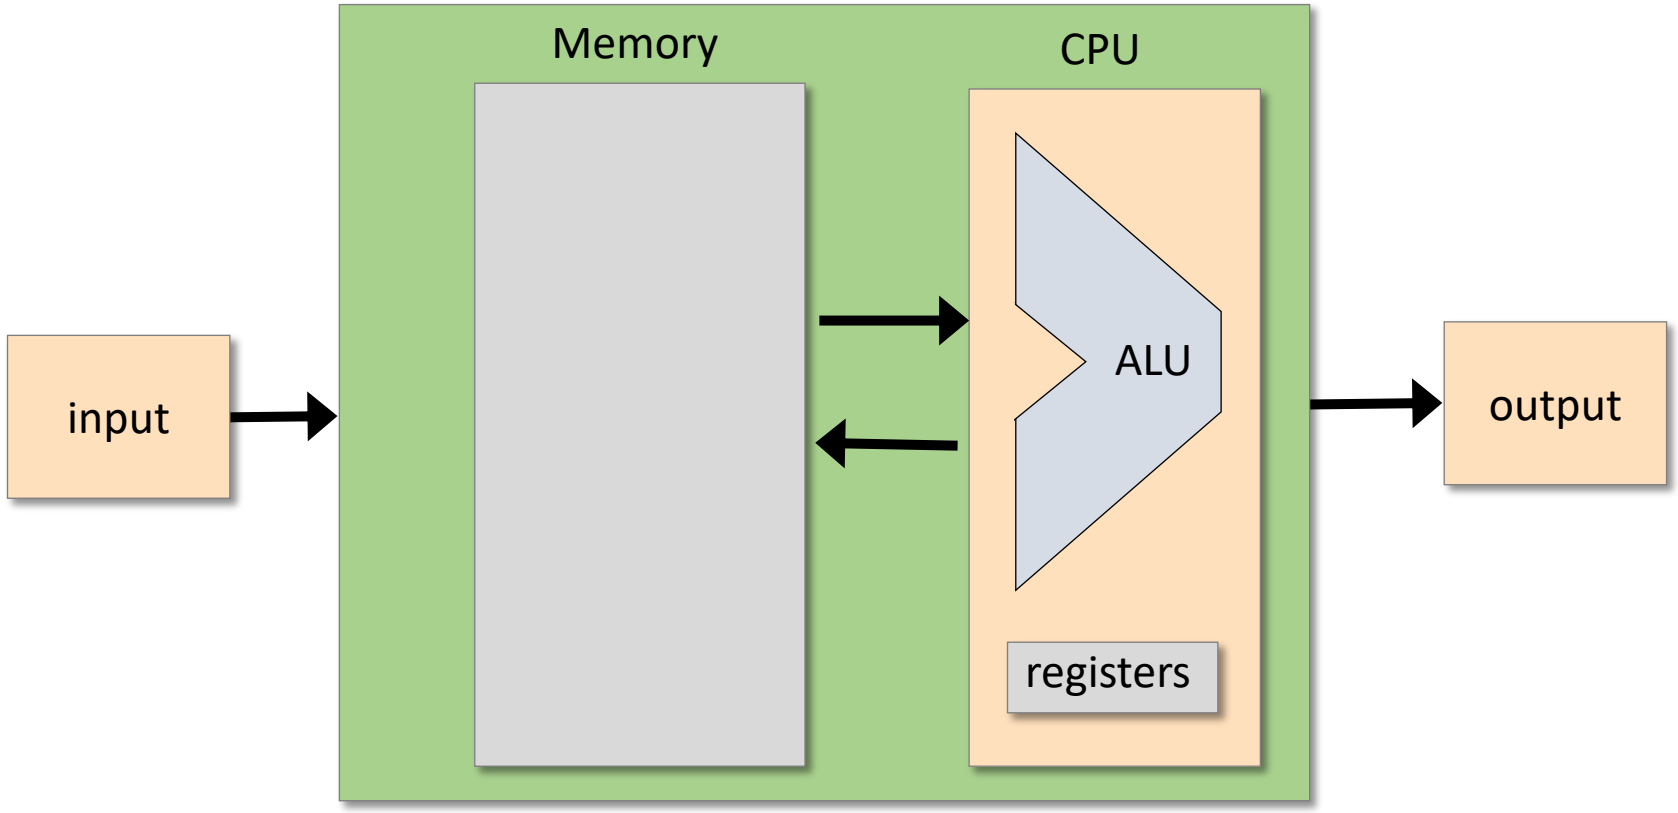
(1945)



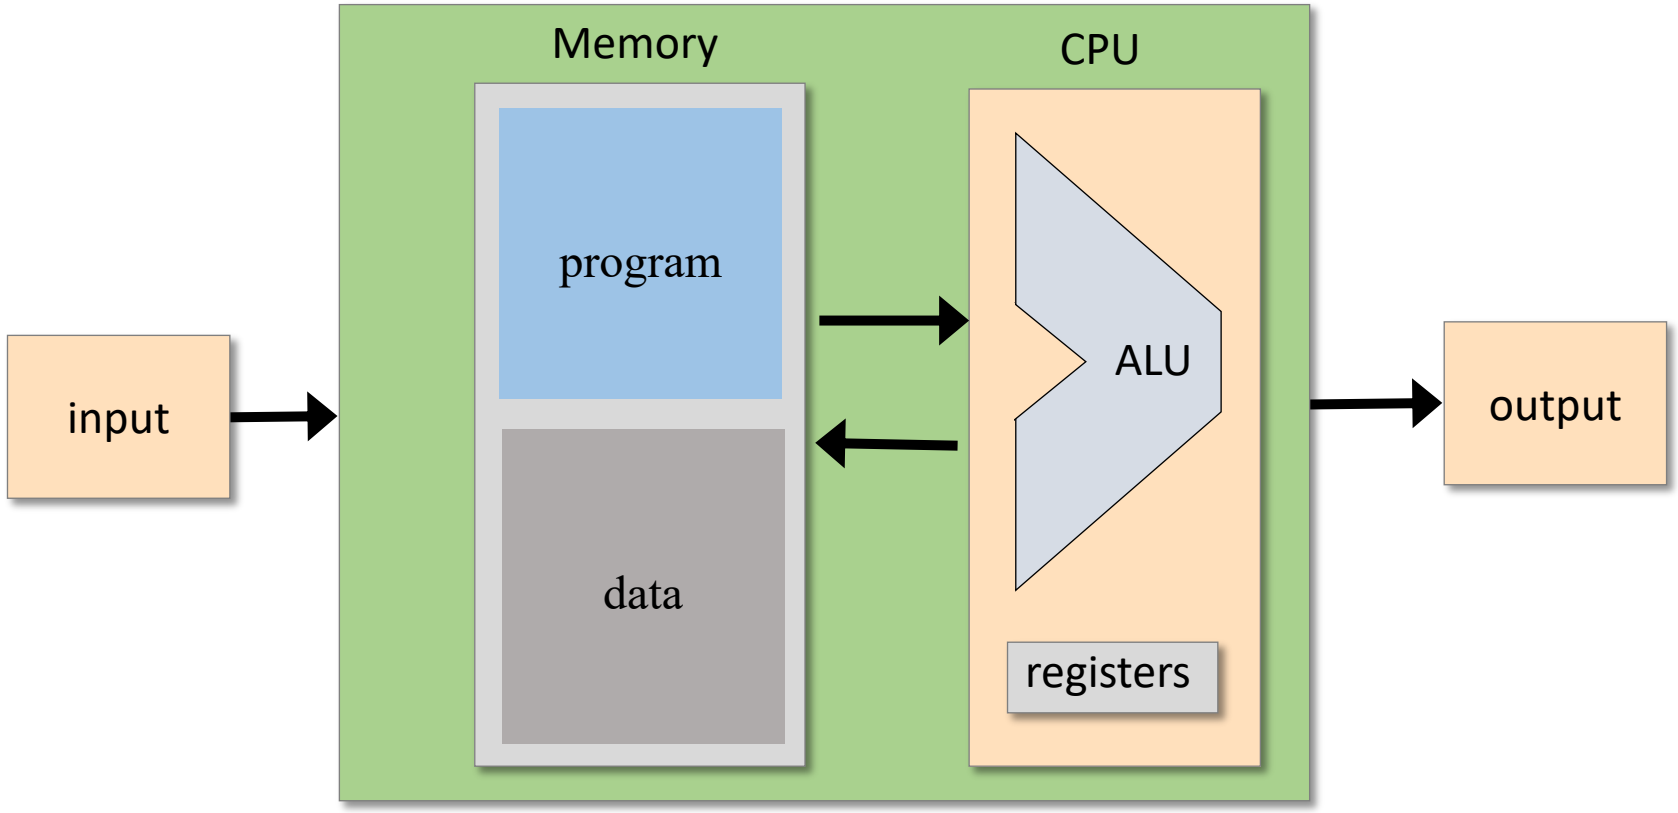
Landmark general-purpose computer

ENIAC, University of Pennsylvania

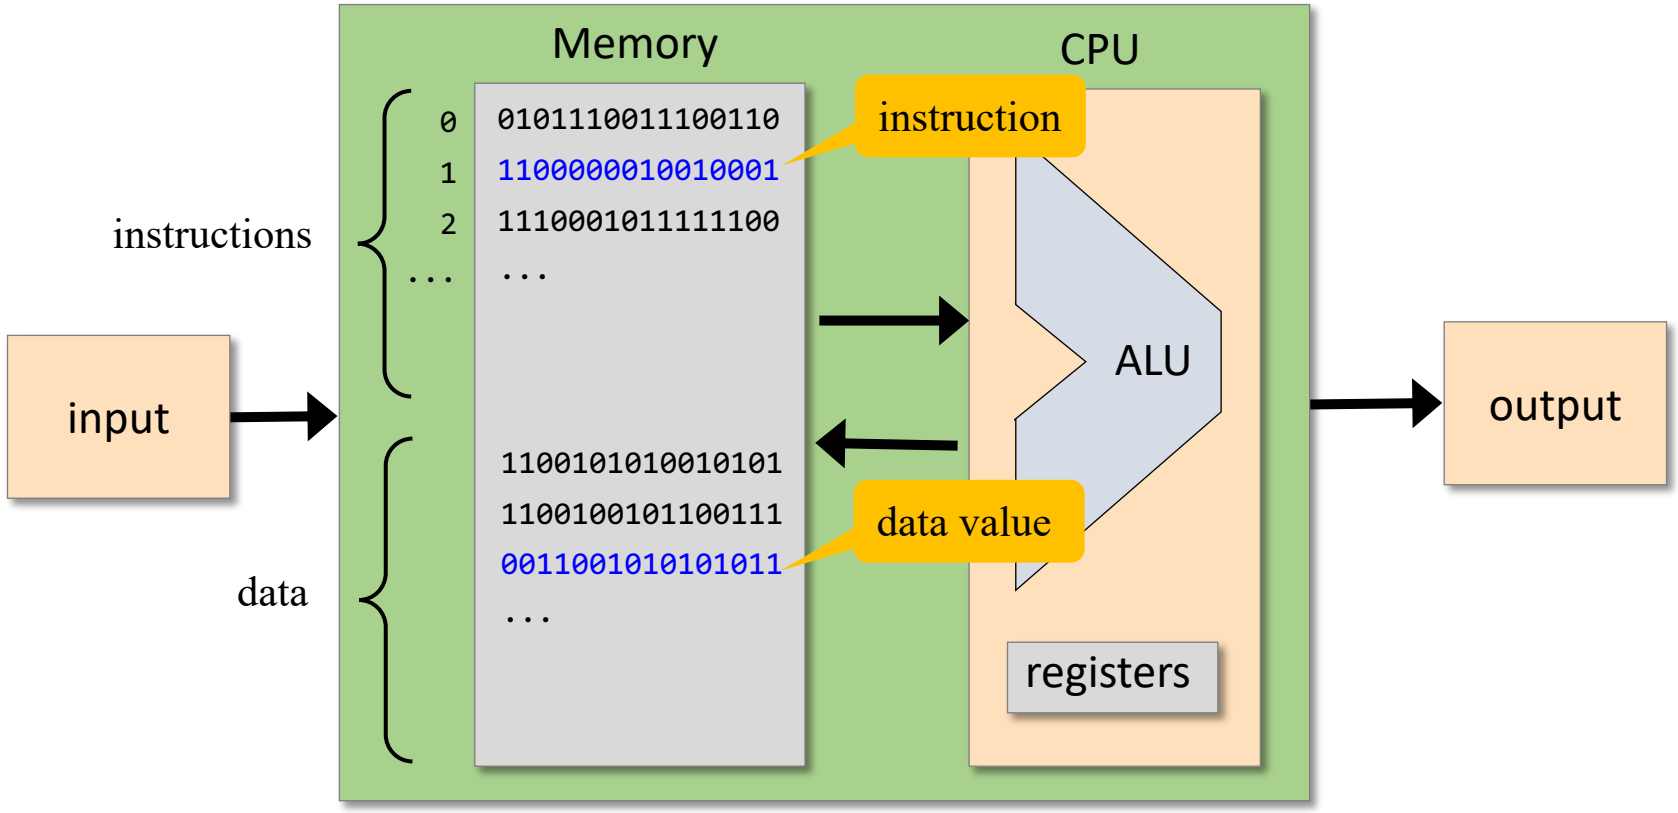
Computer architecture



Computer architecture



Computer architecture



Stored program concept

- The computer memory can store programs, just like it stores data
- Programs = data.

A fundamental idea in the history of computer science

Lecture plan

Overview

- Machine language
- The Hack computer
- The Hack instruction set
- The Hack CPU Emulator

Low Level Programming

- Basic
- Iteration
- Pointers

Symbolic programming

- Control
- Variables
- Labels

The Hack Language

- Symbolic
- Binary
- Output
- Input
- Project 4

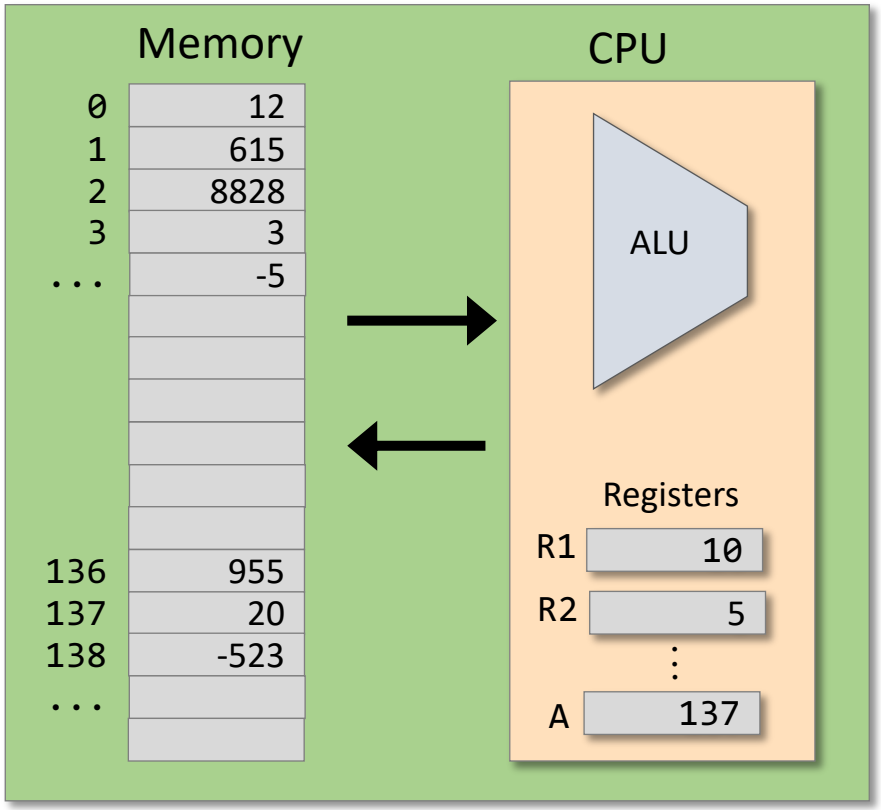
Machine Language

Computer

(conceptual definition):

A processor (CPU) that manipulates a set of *registers*:

- CPU-resident registers
  (few, accessed directly, by name)
- Memory-resident registers
  (many, accessed by address)



Machine language

A formalism for accessing and manipulating registers.

Registers

Data registers

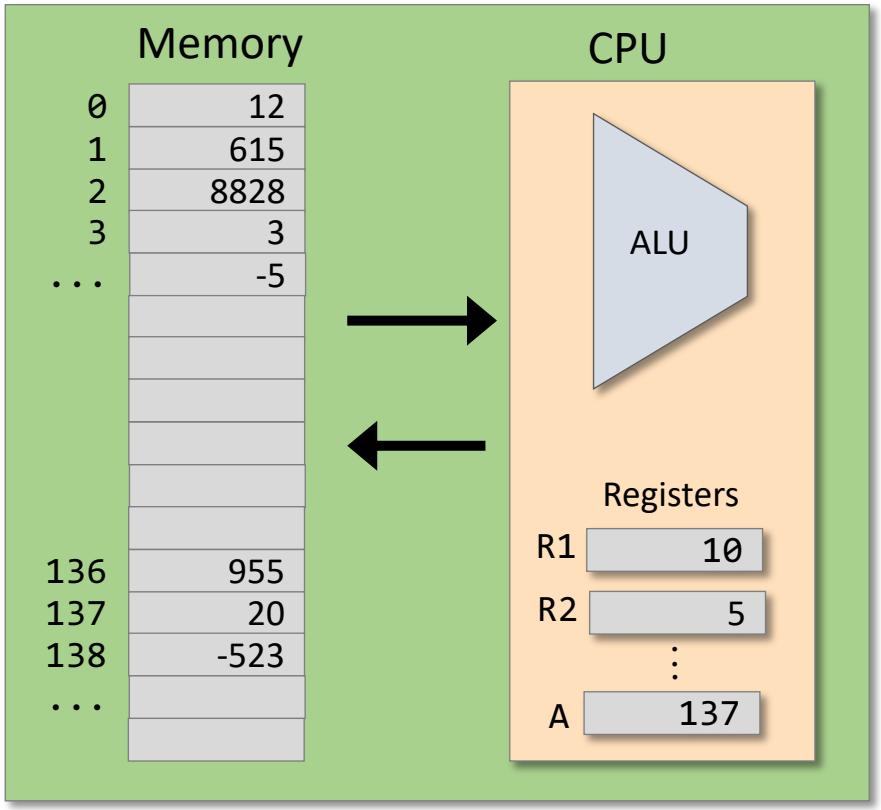
Hold data values

Address register

Holds an address

Instruction register

Holds an instruction



- All these registers are… registers (containers that hold bits)
- The number and bit-width of the registers vary from one computer to another.

Typical operations

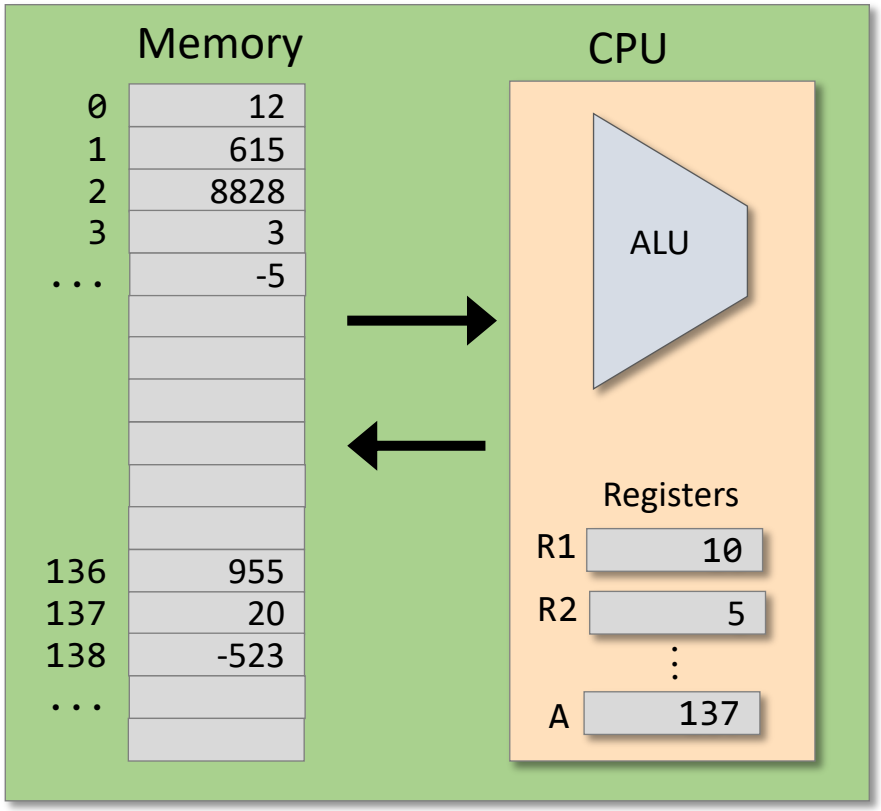
```
// R1 ← R1 + R2
add R1, R2

// R1 ← R1 + 73
addi R1, 73

// R1 ← R2
mov R1, R2

// R1 ← Memory[137]
load R1, 137

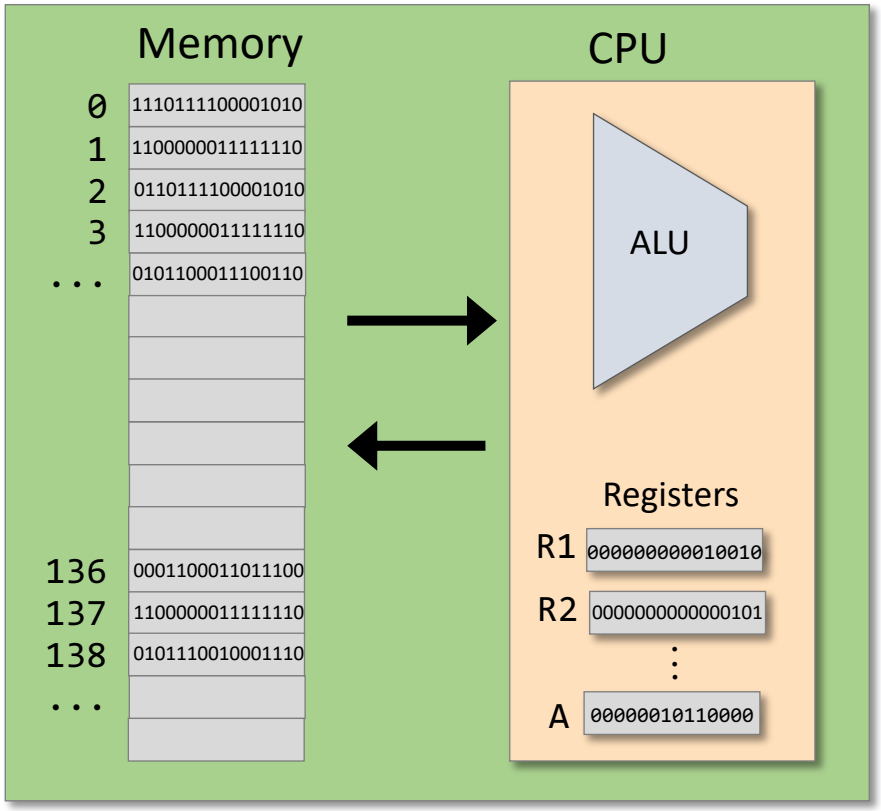
// if R1>0 goto 15
jgt R1, 15
```



The syntax of machine languages varies across computers

The semantics is the same: Manipulating registers.

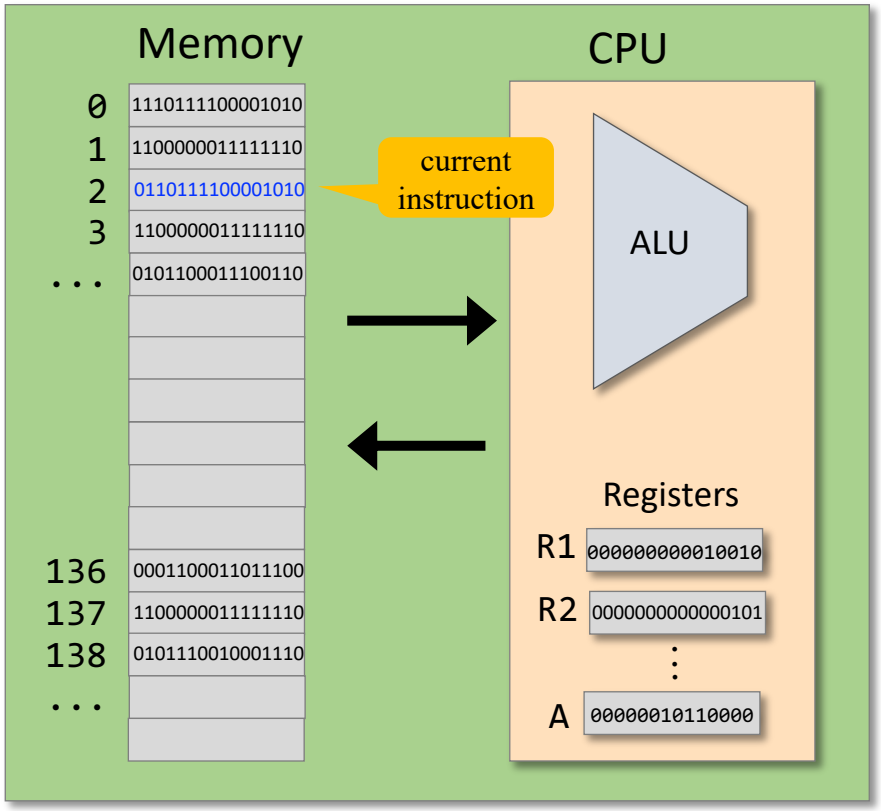
Typical operations



Typical operations

Which instruction should be executed next?

- By default, the CPU executes the *next instruction*
- Sometimes we want to "jump" to execute another instruction



Typical operations

Branching

- Execute an instruction other than the next one
- Example: Embarking on a new iteration in a loop

```
    ...
    // Adds 1 to R1, repetitively
13  addi R1,1
... ...
27  goto 13
... ...
```

Typical operations

Branching

- Execute an instruction other than the next one
- Example: Embarking on a new iteration in a loop

Basic version

```
...
// Adds 1 to R1, repetitively
13   addi R1,1
...  ...
27   goto 13
...  ...
```

- Line numbers
- Physical addresses

Symbolic version

```
     ...
     // Adds 1 to R1, repetitively
(LOOP)
     addi R1,1
     ...
     goto LOOP
     ...
```

- No line numbers
- Symbolic addresses

Programs with symbolic references are …

- Easier to develop
- Readable
- Relocatable.

Typical operations

Conditional branching

Sometimes we want to "jump" to execute an instruction,
but only if a certain condition is met

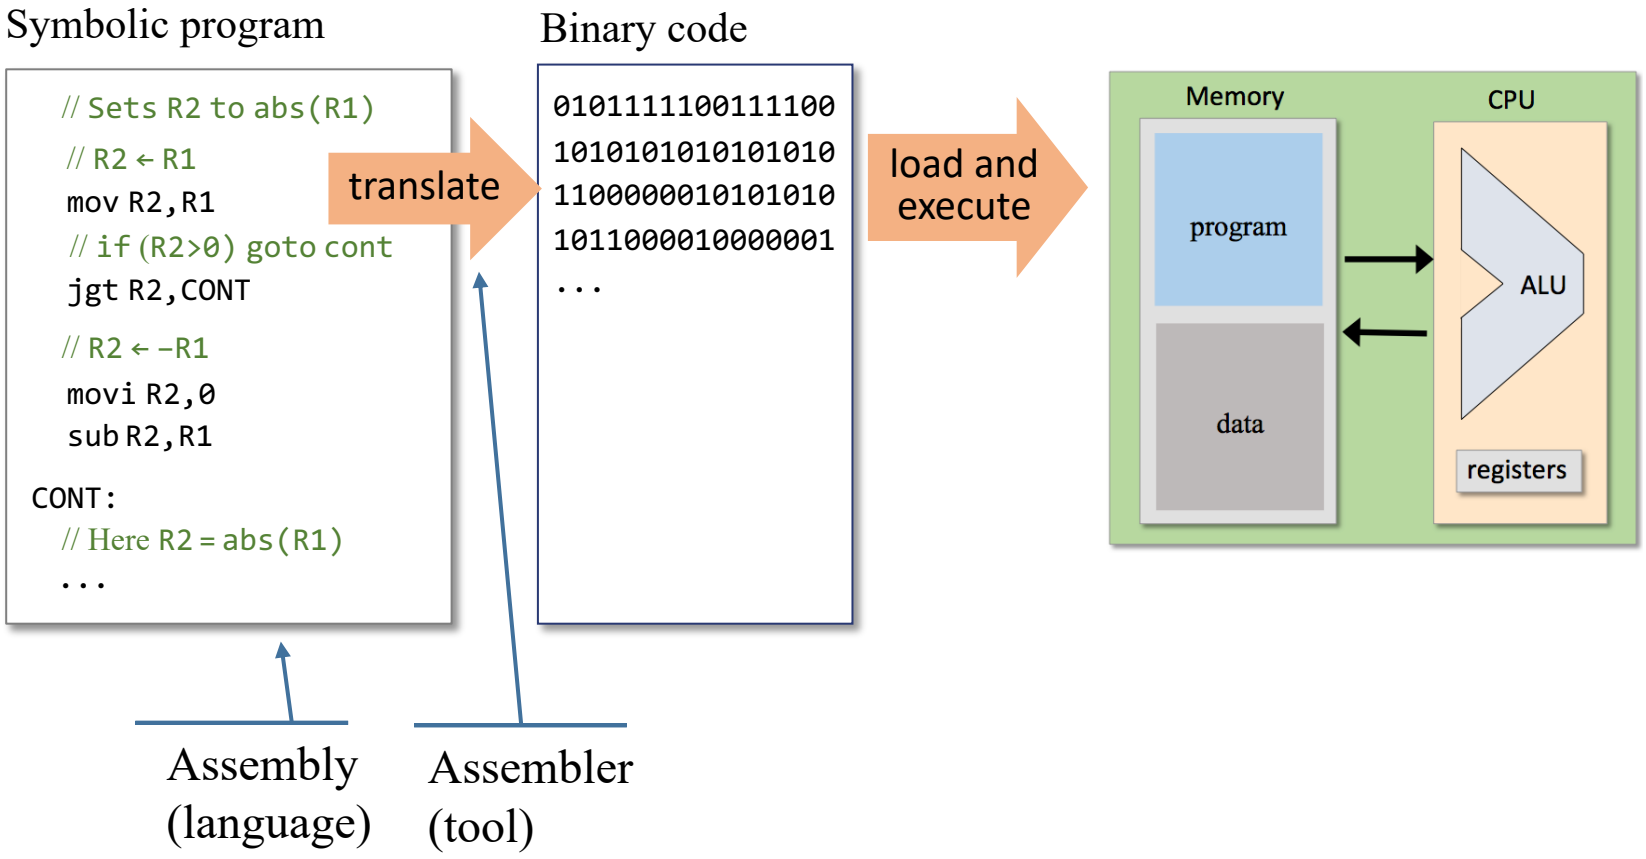
Symbolic program

```
   // Sets R2 to abs(R1)
   // R2 ← R1
   mov R2,R1
   // if (R2>0) goto cont
   jgt R2,CONT
   // R2 ← –R1
   movi R2,0
   sub R2,R1
CONT:
   // Here R2 = abs(R1)
   ...
```

Program translation and execution

Translation

Before it can be executed, a symbolic program must be translated into instructions that the computer can decode and execute.



Machine Language

Overview

- ✓ Machine language
- The Hack computer
- The Hack instruction set
- The Hack CPU Emulator

Low Level Programming

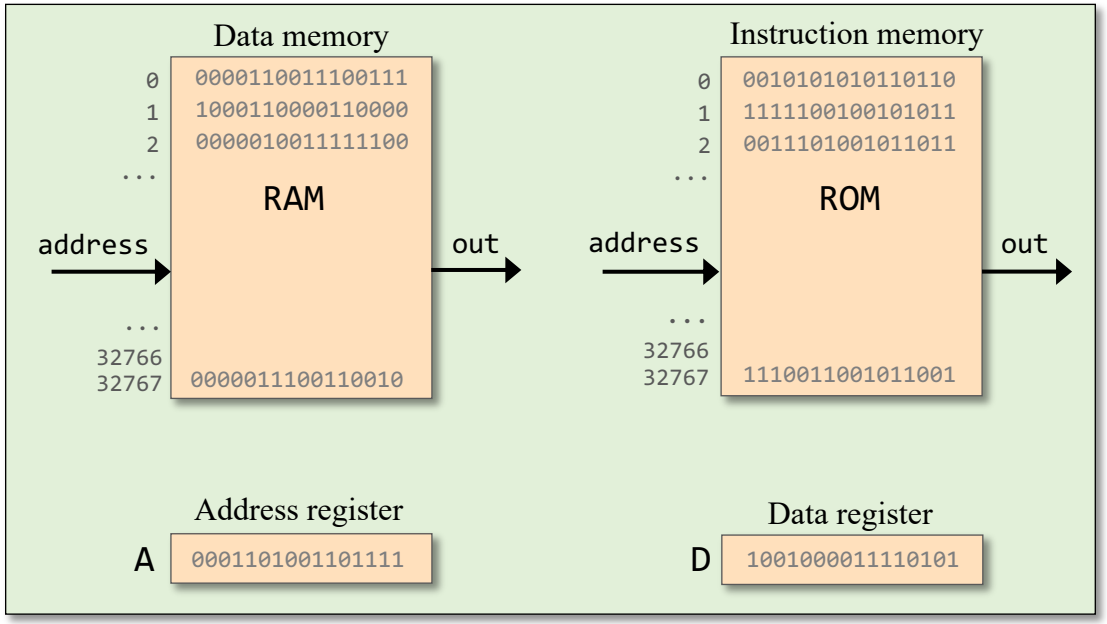
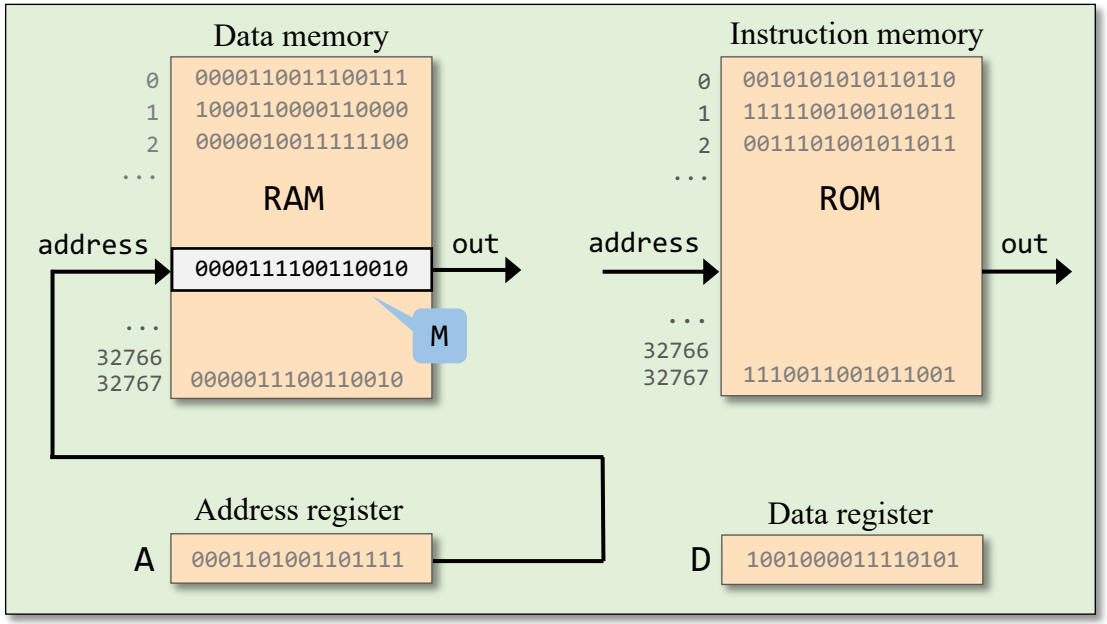
The Hack computer



(Conceptual, partial view of the Hack computer architecture)

Hack: a 16-bit computer, featuring two memory units

Memory

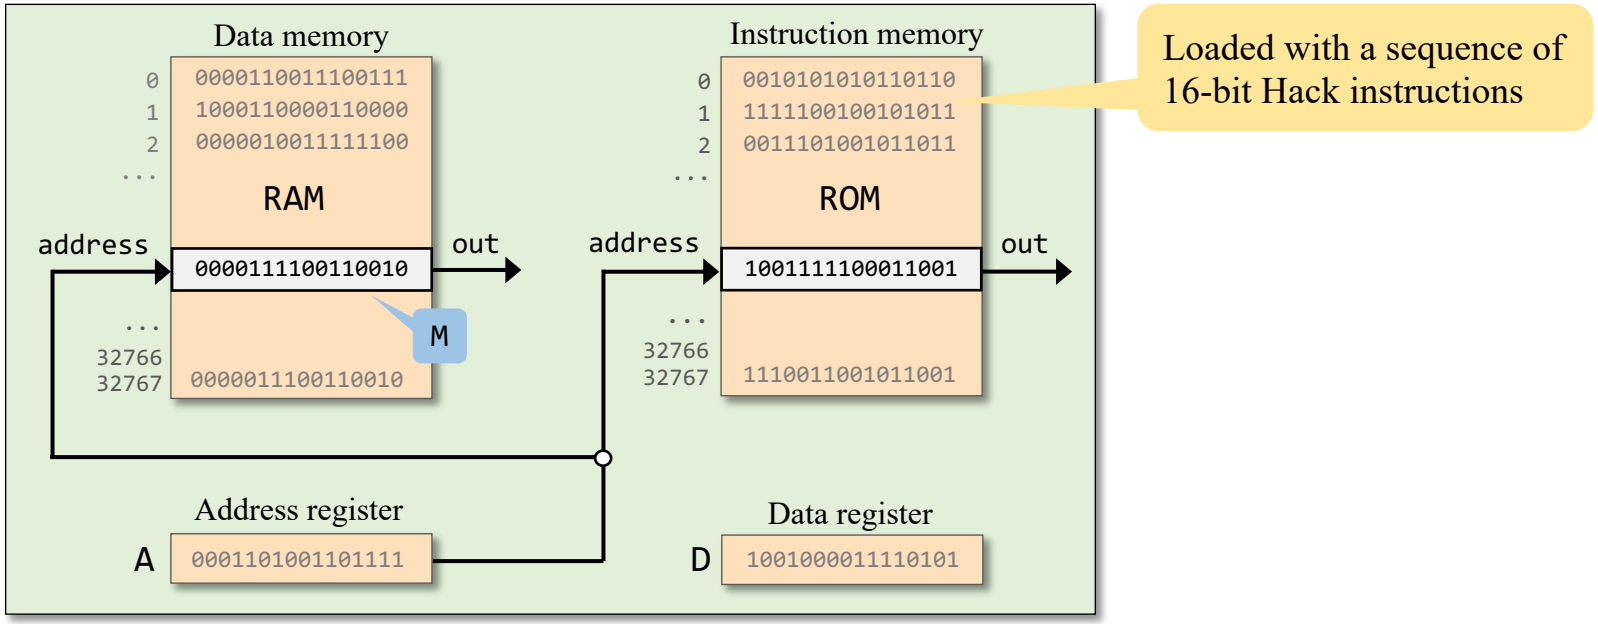


(Conceptual, partial view of the Hack computer architecture)

RAM

- Read-write data memory
- Addressed by the `A` register
- The selected memory location, `RAM[A]`, is referred to as `M`

Memory



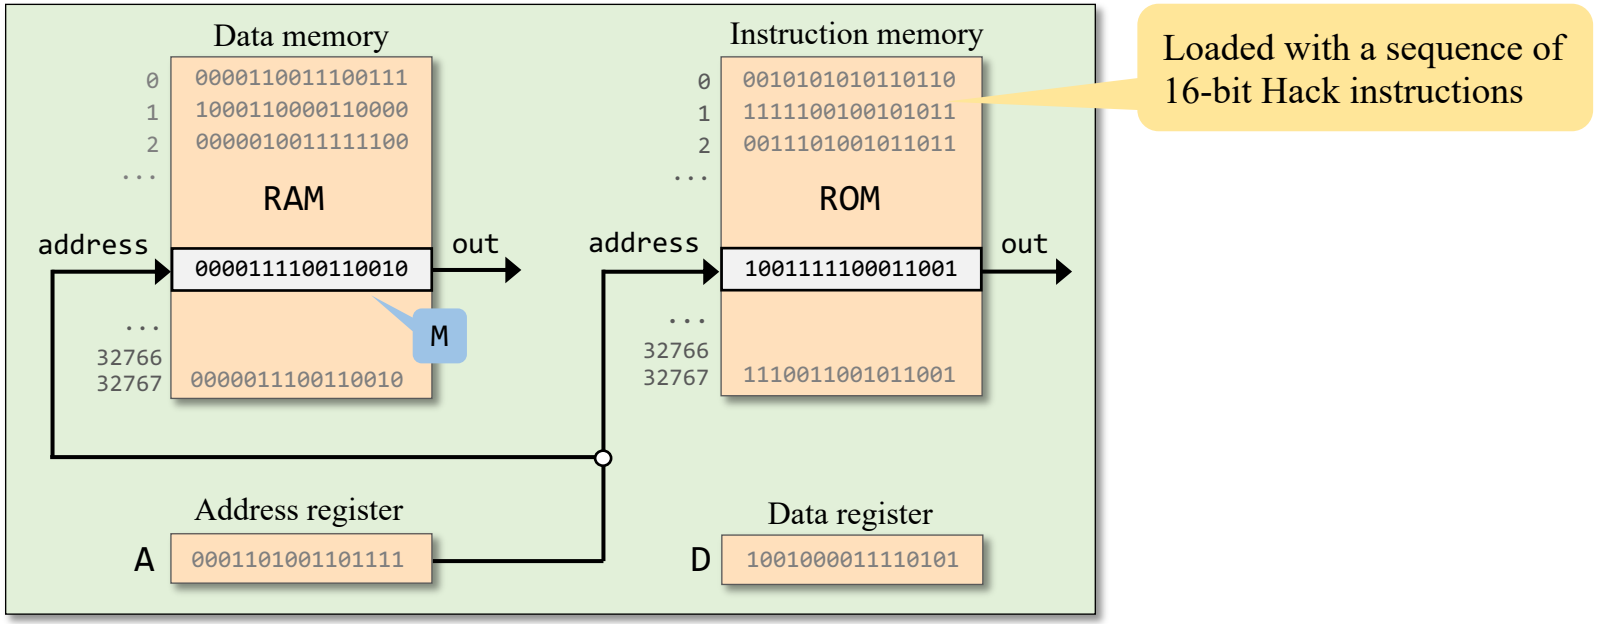
RAM

- Read-write data memory
- Addressed by the `A` register
- The selected memory location, `RAM[A]`, is referred to as `M`

ROM

- Read-only instruction memory
- Addressed by the (same) `A` register
- The selected memory location, `ROM[A]`, contains the *current instruction*

Memory



RAM

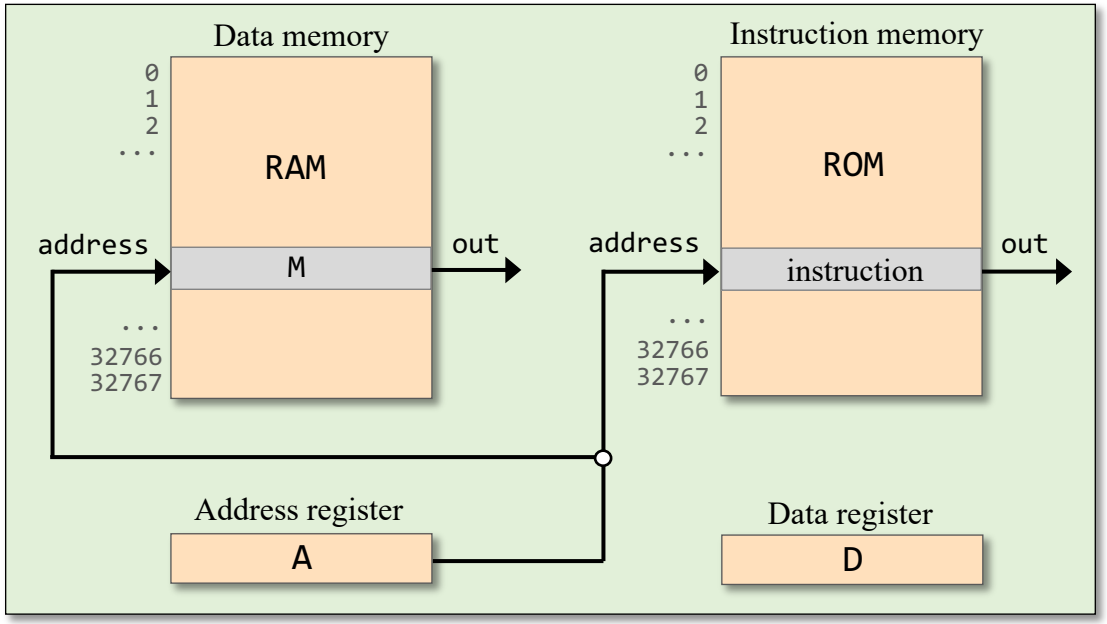
- Read-write data memory
- Addressed by the `A` register
- The selected memory location, `RAM[A]`, is referred to as `M`

ROM

- Read-only instruction memory
- Addressed by the (same) `A` register
- The selected memory location, `ROM[A]`, contains the *current instruction*

- Should we focus on `RAM[A]`, or on `ROM[A]`?
- Depends on the *current instruction* (later)

Registers



(Conceptual, partial view of the Hack computer architecture)

`D`: data register

`A`: address register

`M`: selected RAM location

Machine Language

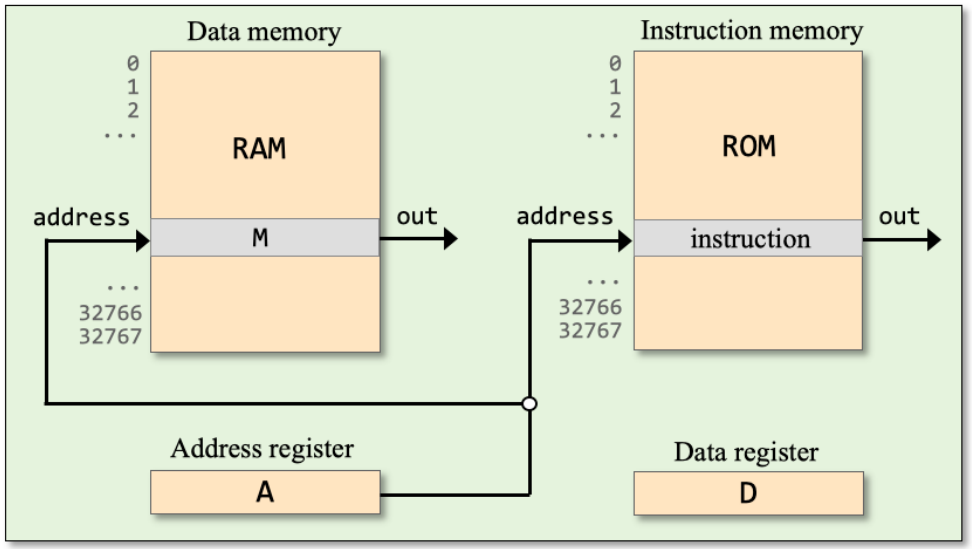
Hack instructions

Instruction set

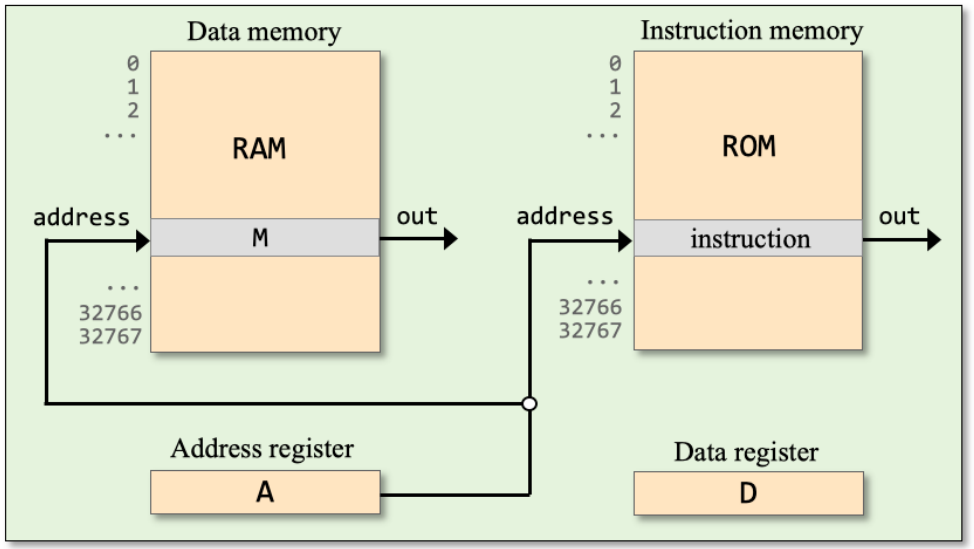
- A - instruction *(address)*
- C - instruction *(compute)*



Hack instructions

Instruction set

- A - instruction (*address*)
- C - instruction (*compute*)



Syntax:

`@xxx`

where *xxx* is a non-negative integer

Example

```
@19
```

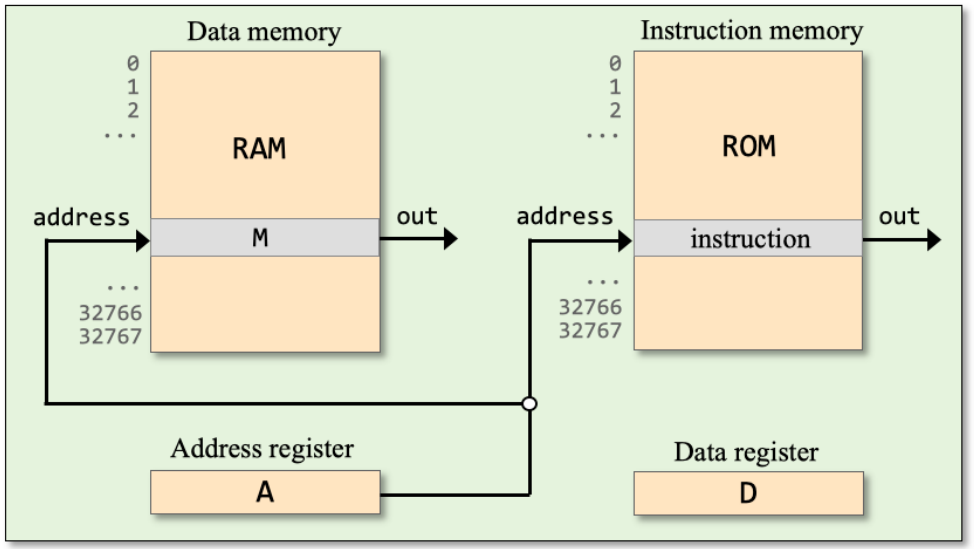
Semantics

A ← 19

Side effects:

- `RAM[A]` (denoted `M`) becomes selected
- `ROM[A]` becomes selected

Hack instructions



Instruction set

- A - instruction (*address*)
- C - instruction (*compute*)

Syntax:

$reg = \{0|1|-1\}$

where $reg = \{A|D|M\}$

$reg_1 = reg_2$

where $reg_1 = \{A|D|M\}$

$reg_2 = [-]\{A|D|M\}$

$reg = reg_1\ op\ reg_2$

where $reg, reg_1 = \{A|D|M\}$

$reg_2 = \{A|D|M|1\}$

$op = \{+|-|\&|\mid\}$

Examples:

```
D=0
A=-1
M=1
...
```

```
D=A
D=M
M=-M
...
```

```
D=D+M
A=A-1
M=D+1
...
```

(Complete / formal syntax, later).

Hack instructions

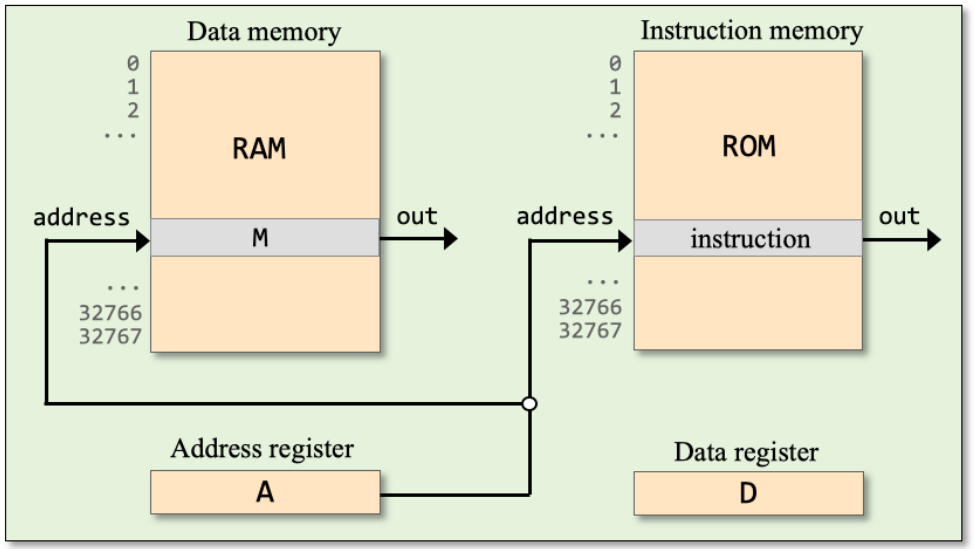
Typical instructions:

`@`*constant* (A ← *constant*)

```
D=1
D=A
D=D+1
...
```

```
D=D+A
D=M
M=0
...
```

```
M=D
D=D+A
M=M-D
...
```



Examples:

```
// D ← 2
?
```

The game: We show a subset of Hack instructions (top left), and practice writing code examples that use these instructions.

Hack instructions

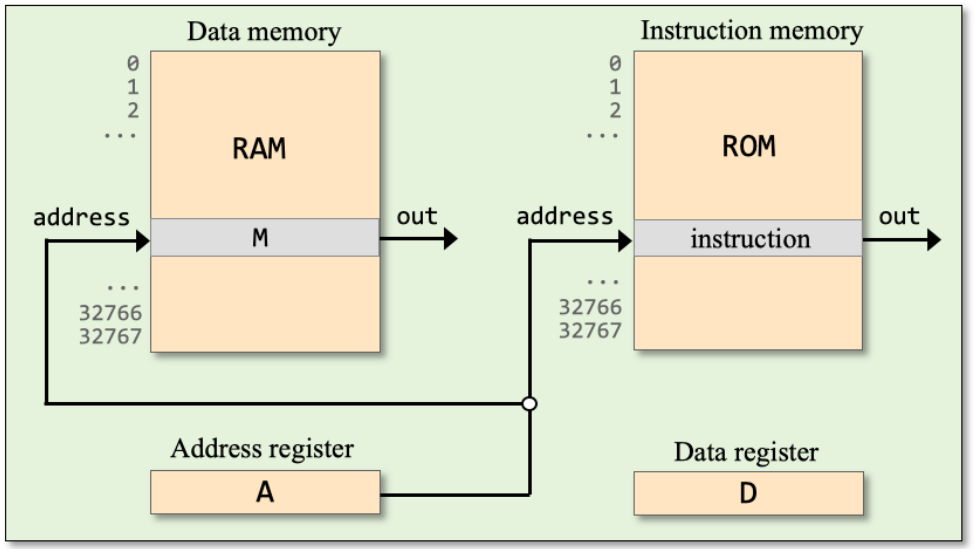
Typical instructions:

`@constant` (A ← *constant*)

```
D=1
D=A
D=D+1
...
```

```
D=D+A
D=M
M=0
...
```

```
M=D
D=D+A
M=M-D
...
```



Examples:

```
// D ← 2
D=1
D=D+1
```

```
// D ← 1954
?
```

Use only the instructions shown above

Hack instructions

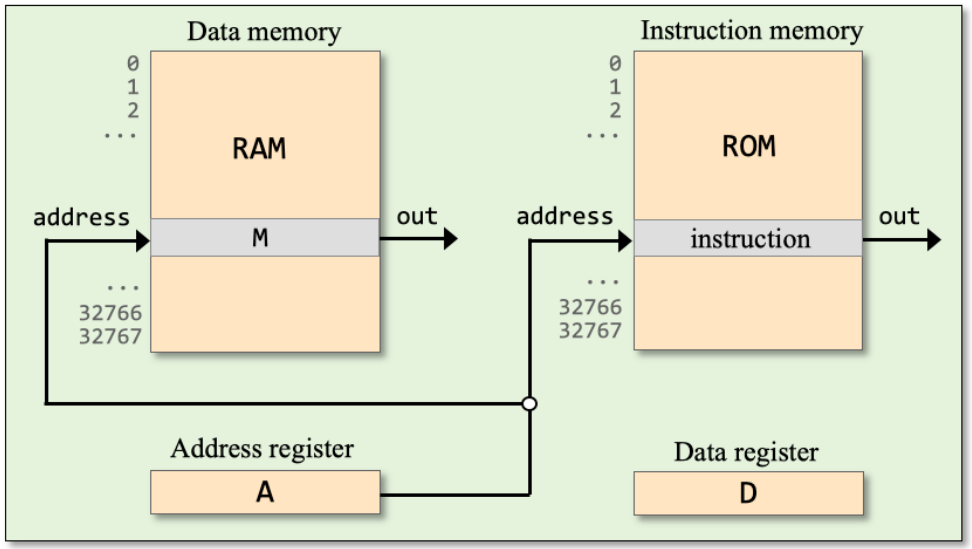
Typical instructions:

`@`*constant* (A ← *constant*)

```
D=1
D=A
D=D+1
...
```

```
D=D+A
D=M
M=0
...
```

```
M=D
D=D+A
M=M-D
...
```



Examples:

```
// D ← 2
D=1
D=D+1
```

```
// D ← 1954
@1954
D=A
```

```
// D ← D + 23
?
```

Use only the instructions shown above

Hack instructions

Typical instructions:

`@`*constant* (A ← *constant*)

```
D=1
D=A
D=D+1
...
```

```
D=D+A
D=M
M=0
...
```

```
M=D
D=D+A
M=M-D
...
```

Examples:

```
// D ← 2
D=1
D=D+1
```

```
// D ← 1954
@1954
D=A
```

```
// D ← D + 23
@23
D=D+A
```

Observation

In all these examples we used `A` as a *data register*:

The addressing side-effects of `A` are ignored.

Hack instructions

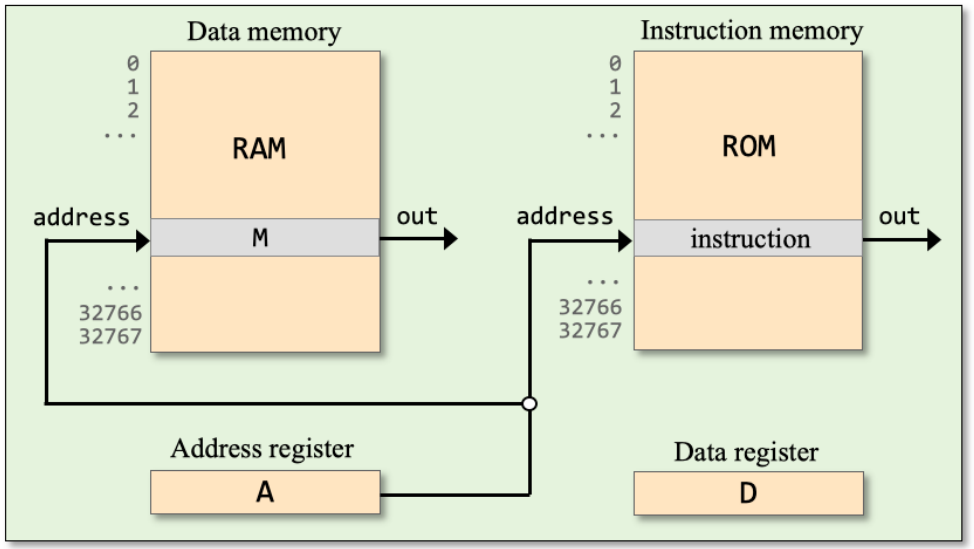
Typical instructions:

`@`*constant* (A←*constant*)

```
D=1
D=A
D=D+1
...
```

```
D=D+A
D=M
M=0
...
```

```
M=D
D=D+A
M=M-D
...
```



More examples:

```
// RAM[100] ← 0
@100
M=0
```

```
// RAM[100] ← 17
@17
D=A
@100
M=D
```

- First pair of instructions:
  A is used as a *data register*
- Second pair of instructions:
  A is used as an *address register*

Hack instructions

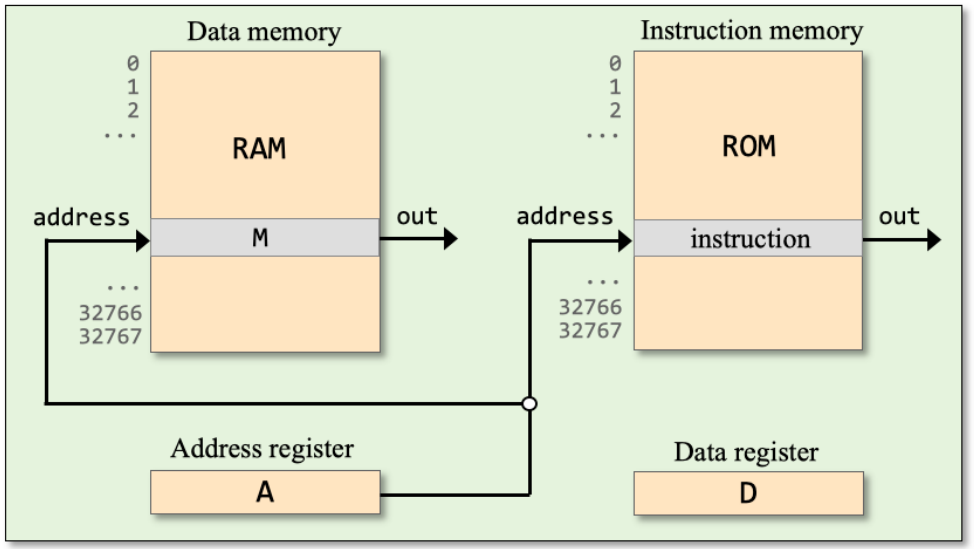
Typical instructions:

`@constant` (A ← *constant*)

```
D=1
D=A
D=D+1
...
```

```
D=D+A
D=M
M=0
...
```

```
M=D
D=D+A
M=M-D
...
```



More examples:

```
// RAM[100] ← 0
@100
M=0
```

```
// RAM[100] ← 17
@17
D=A
@100
M=D
```

```
// RAM[100] ← RAM[200]

?
```

Hack instructions

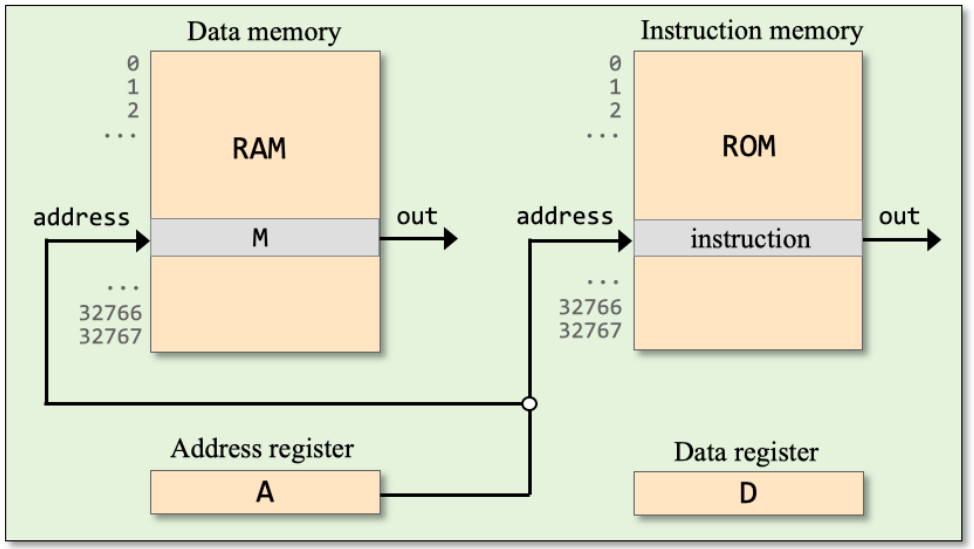
Typical instructions:

`@constant` (A←*constant*)

```
D=1
D=A
D=D+1
...
```

```
D=D+A
D=M
M=0
...
```

```
M=D
D=D+A
M=M-D
...
```



More examples:

```
// RAM[100] ← 0
@100
M=0
```

```
// RAM[100] ← 17
@17
D=A
@100
M=D
```

```
// RAM[100] ← RAM[200]
@200
D=M
@100
M=D
```

When we want to operate on a memory location, we typically need a pair of instructions:

- A-instruction: Selects a memory location
- C-instruction: Operates on the selected location.

Hack instructions

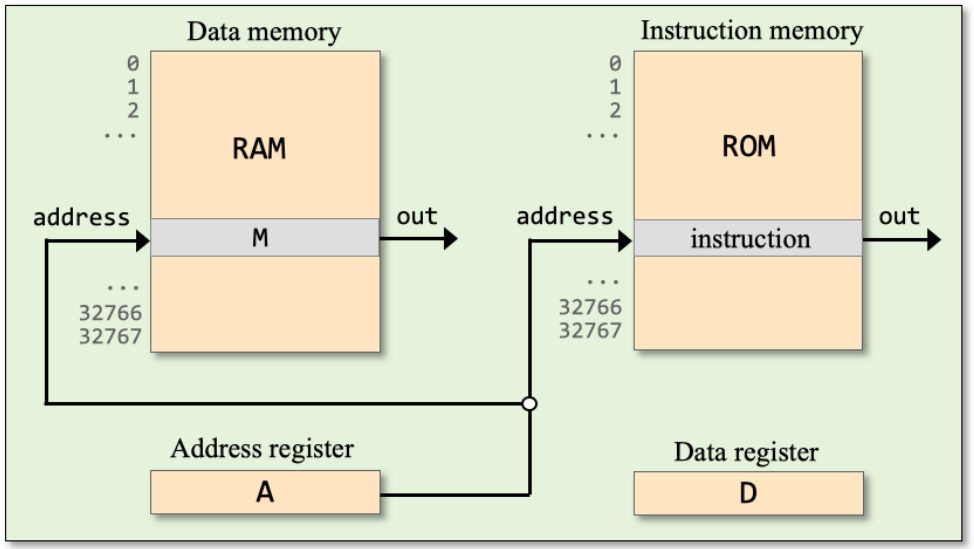
Typical instructions:

`@`*constant* (A←*constant*)

```
D=1
D=A
D=D+1
...
```

```
D=D+A
D=M
M=0
...
```

```
M=D
D=D+A
M=M-D
...
```



```
// RAM[3] ← RAM[3] - 15
```

?

Use only the instructions shown above

Hack instructions

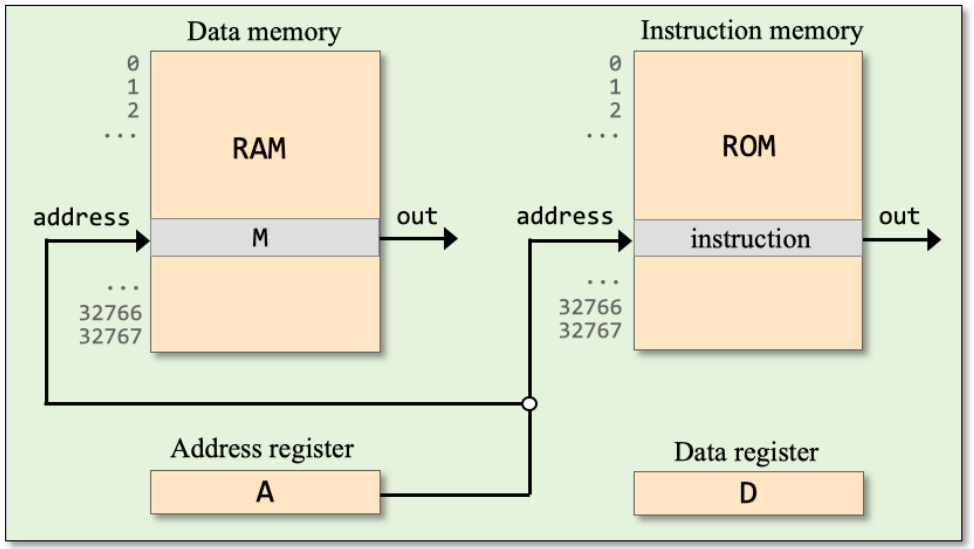
Typical instructions:

`@constant` (A ← *constant*)

```
D=1
D=A
D=D+1
...
```

```
D=D+A
D=M
M=0
...
```

```
M=D
D=D+A
M=M-D
...
```



```
// RAM[3] ← RAM[3] - 15
@15
D=A
@3
M=M-D
```

Use only the instructions shown above

```
// RAM[3] ← RAM[4] + 1
```

?

Hack instructions

Typical instructions:

`@`*constant* (A ← *constant*)

```
D=1
D=A
D=D+1
...
```

```
D=D+A
D=M
M=0
...
```

```
M=D
D=D+A
M=M-D
...
```

```
// RAM[3] ← RAM[3] - 15
@15
D=A
@3
M=M-D
```

Use only the instructions shown above

```
// RAM[3] ← RAM[4] + 1
@4
D=M+1
@3
M=D
```

Hack instructions

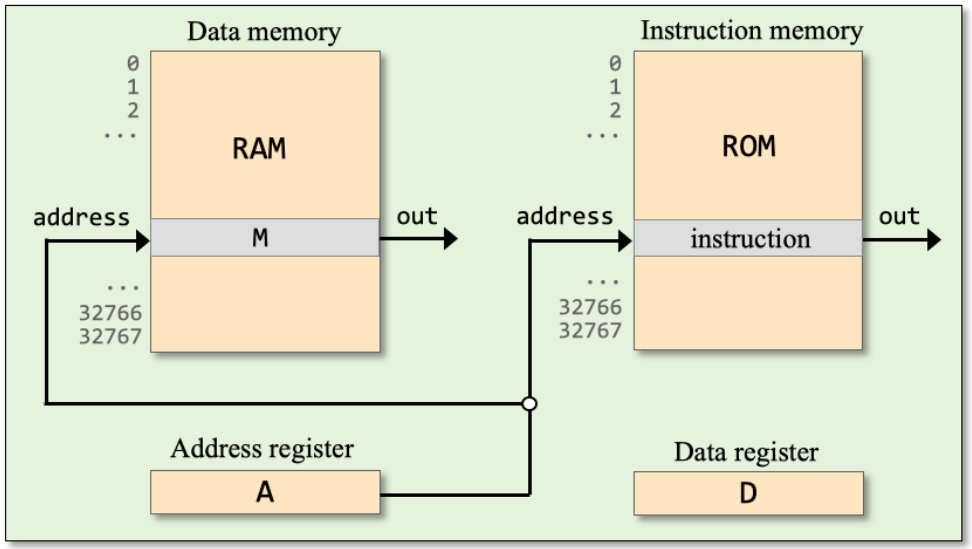
Typical instructions:

`@constant` (A ← *constant*)

```
A=1
D=-1
M=0
...
```

```
A=M
D=M
M=D
...
```

```
A=D-A
D=D+A
D=D+M
...
```



`Add.asm`

```
// Computes: RAM[2] = RAM[0] + RAM[1] + 17

?
```

Use only the instructions shown above

Hack instructions

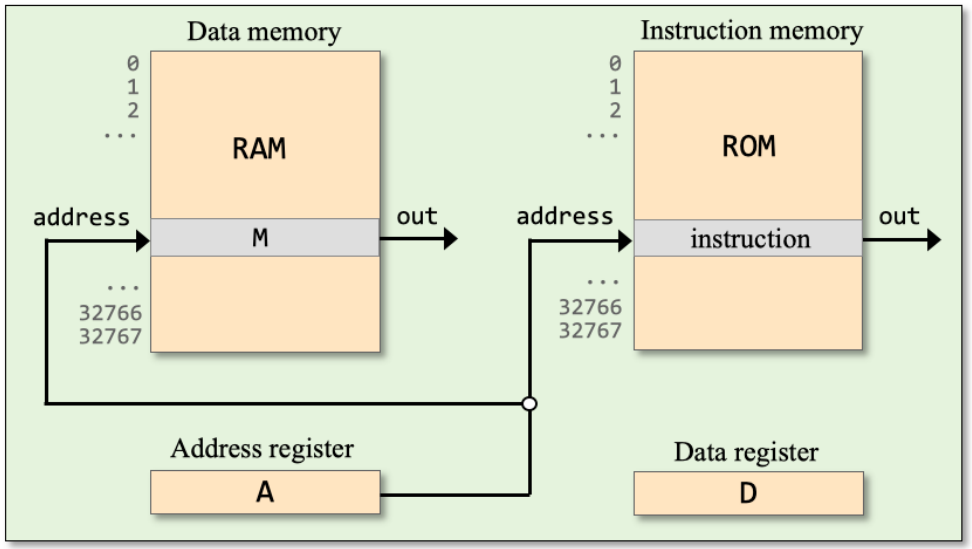
Typical instructions:

`@constant` (A←*constant*)

```
A=1
D=-1
M=0
...
```

```
A=M
D=M
M=D
...
```

```
A=D-A
D=D+A
D=D+M
...
```



Add.asm

```
// Computes: RAM[2] = RAM[0] + RAM[1] + 17

// D = RAM[0]
@0
D=M
// D = D + RAM[1]
@1
D=D+M
// D = D + 17
@17
D=D+A
// RAM[2] = D
@2
M=D
```

Hack instructions

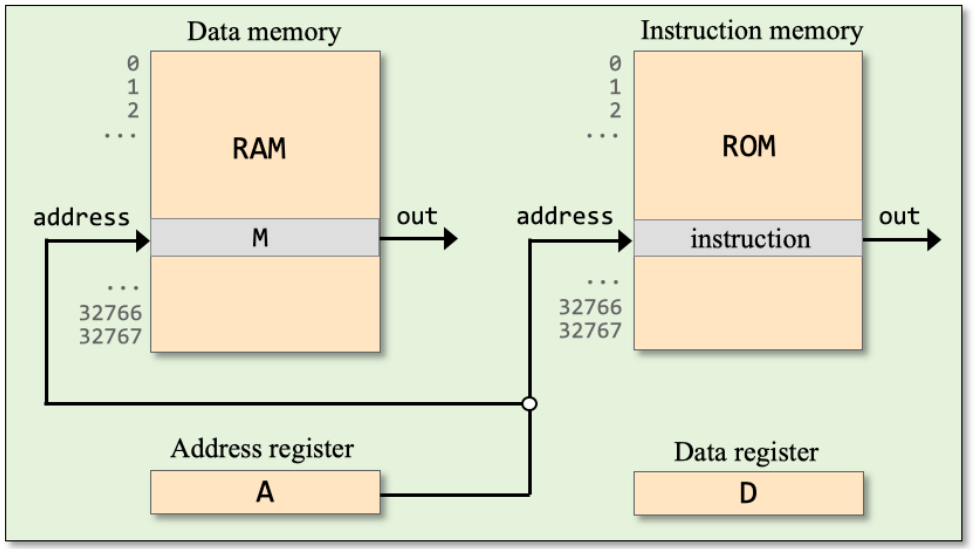
Typical instructions:

`@constant` (A←*constant*)

```
A=1
D=-1
M=0
...
```

```
A=M
D=M
M=D
...
```

```
A=D-A
D=D+A
D=D+M
...
```



Add.asm

```
// Computes: RAM[2] = RAM[0] + RAM[1] + 17

// D = RAM[0]
@0
D=M
// D = D + RAM[1]
@1
D=D+M
// D = D + 17
@17
D=D+A
// RAM[2] = D
@2
M=D
```

How can we tell that a given program *actually works*?

➡ Testing / simulating

- Formal verification

Machine Language

Overview

- Project 4

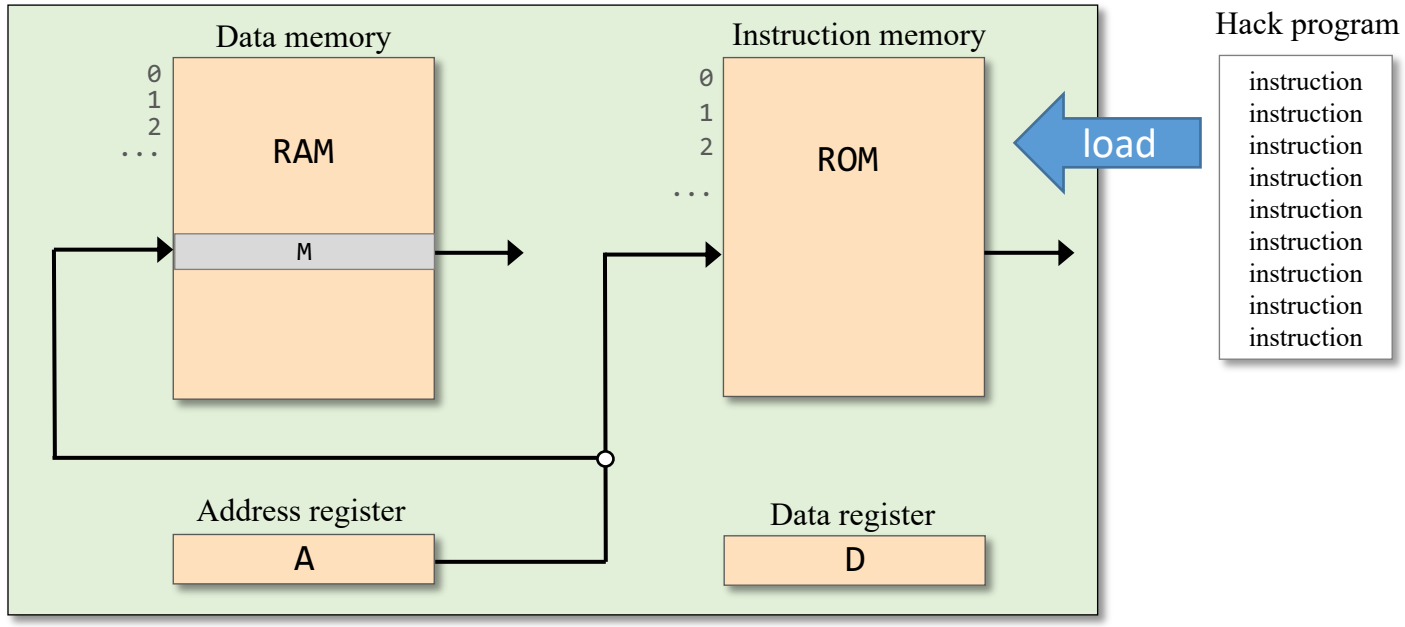
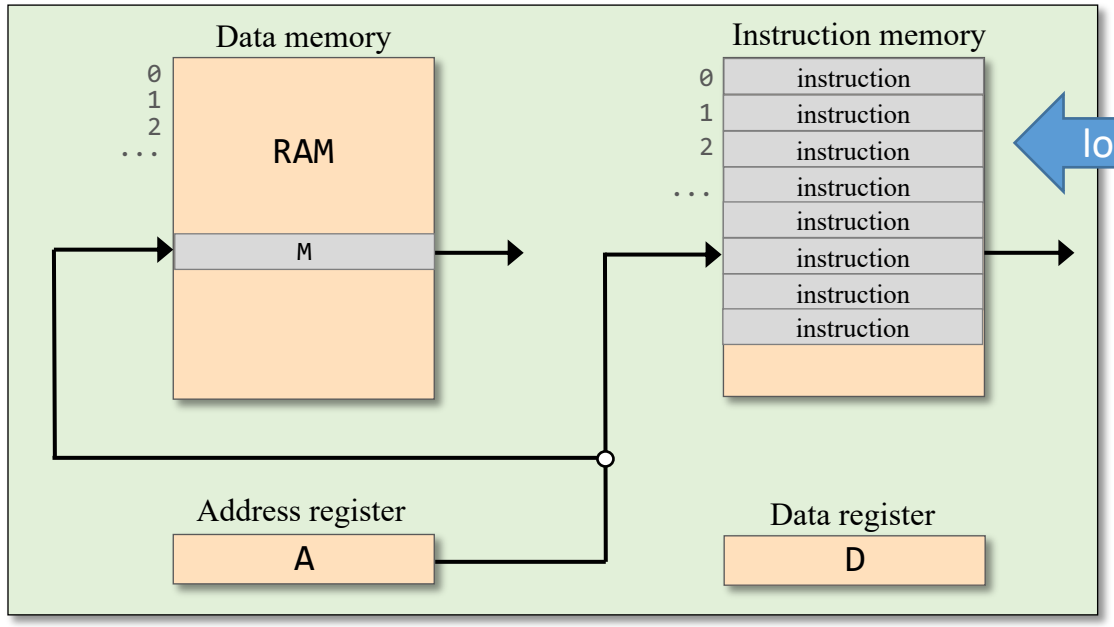
Loading a program



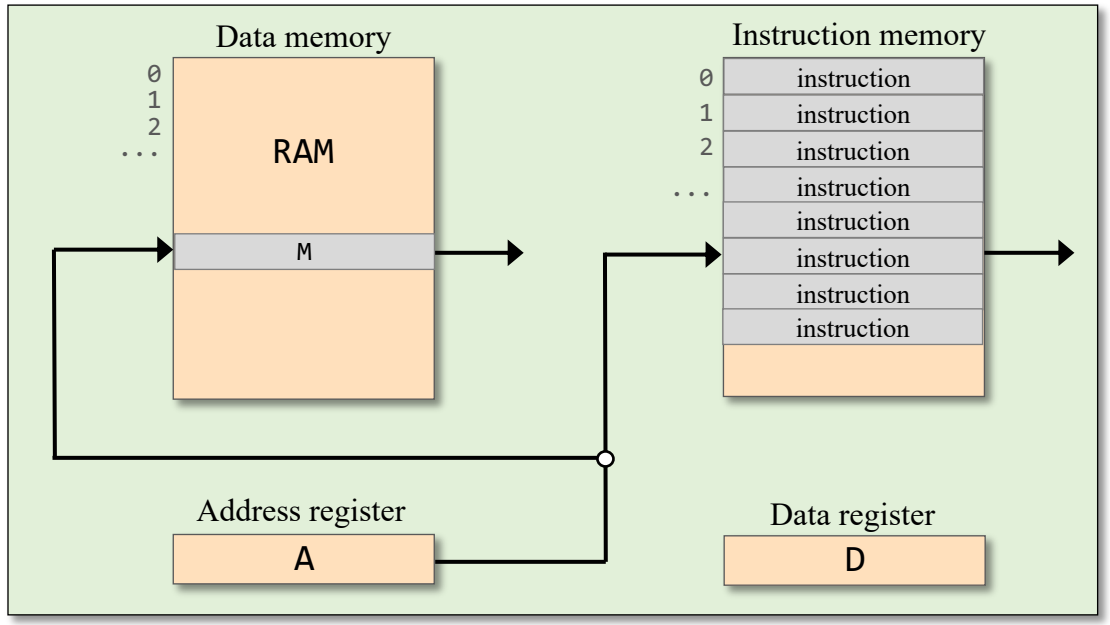
Loading a program



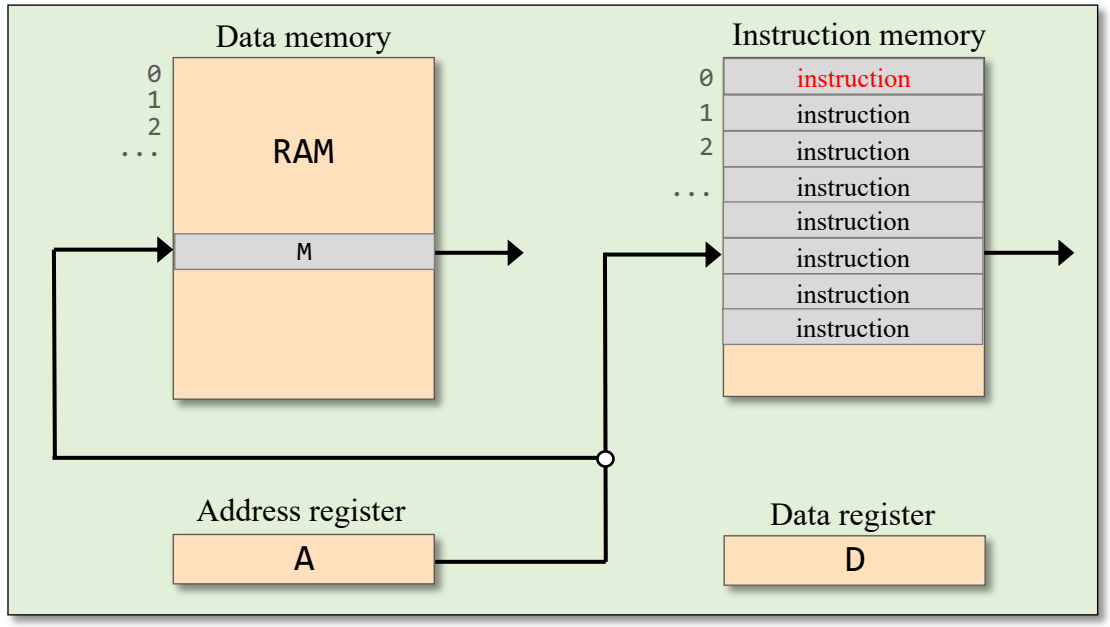
Convention:

The first instruction is loaded into address 0, the next instruction into address 1, and so on.

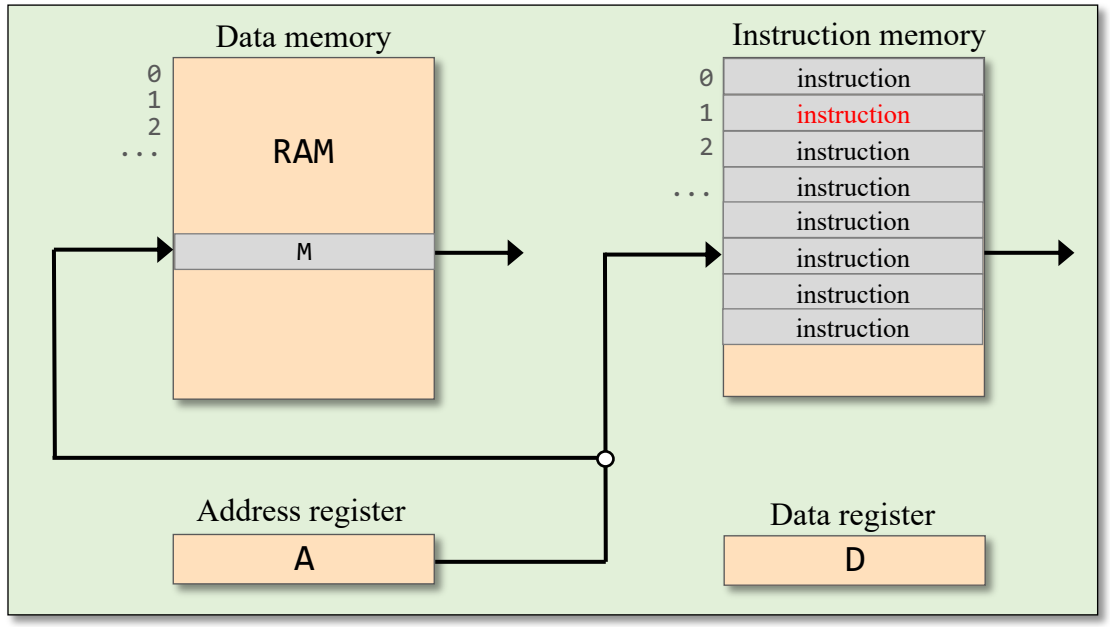
Executing a program



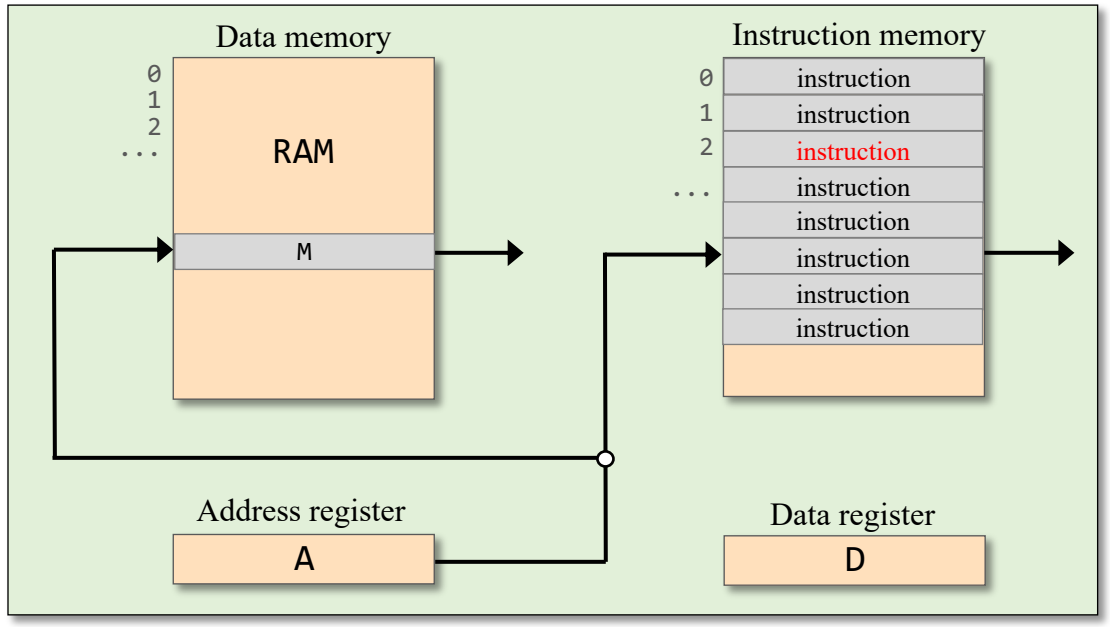
Executing a program



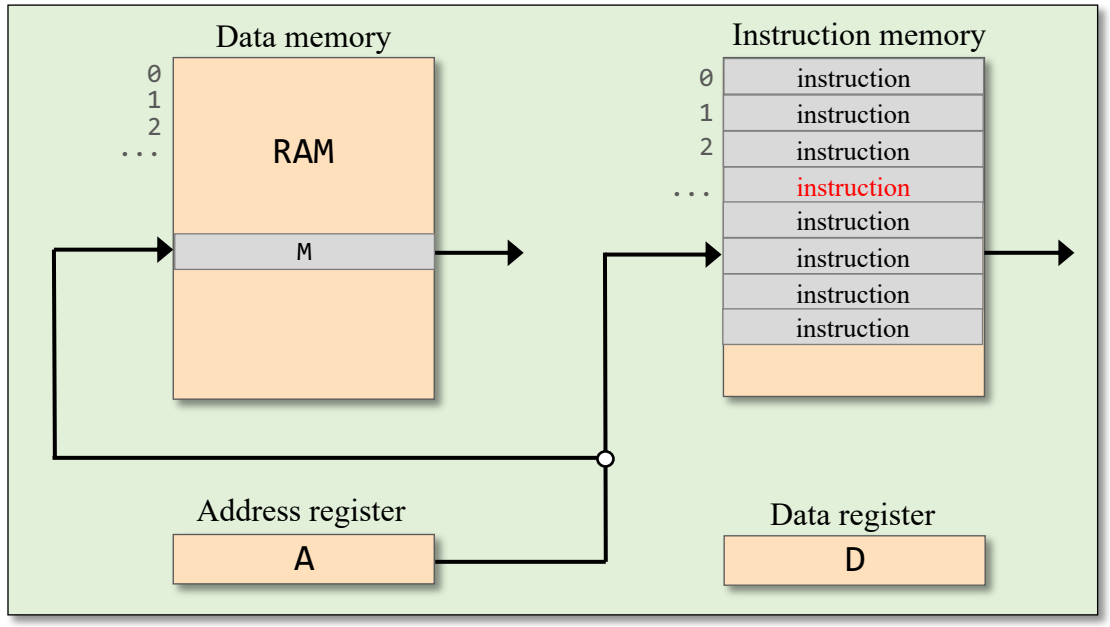
Executing a program



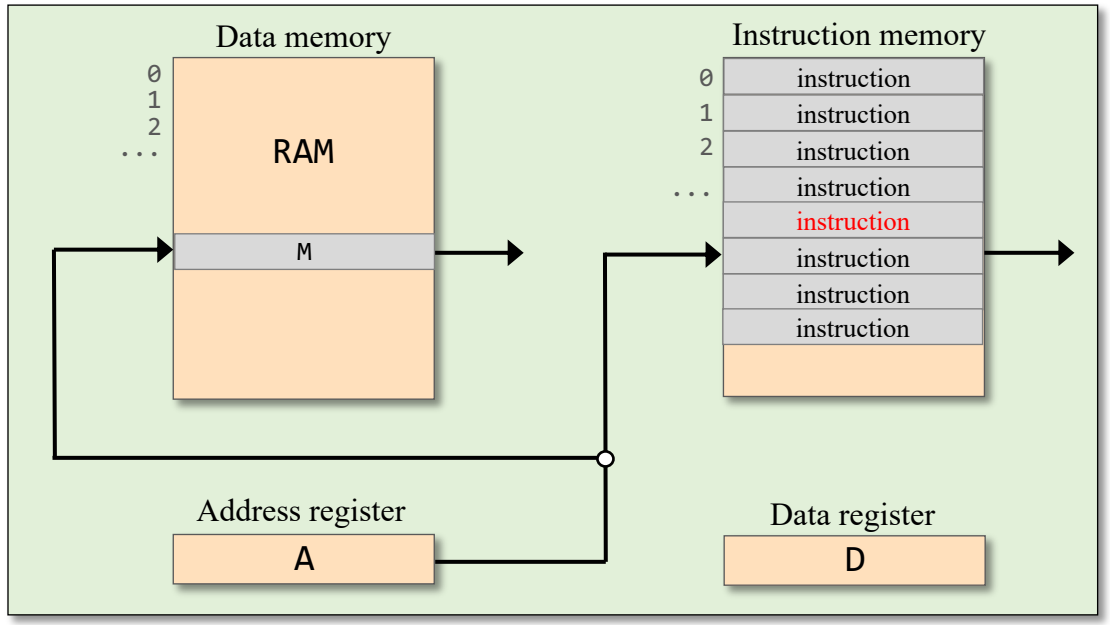
Executing a program



Executing a program

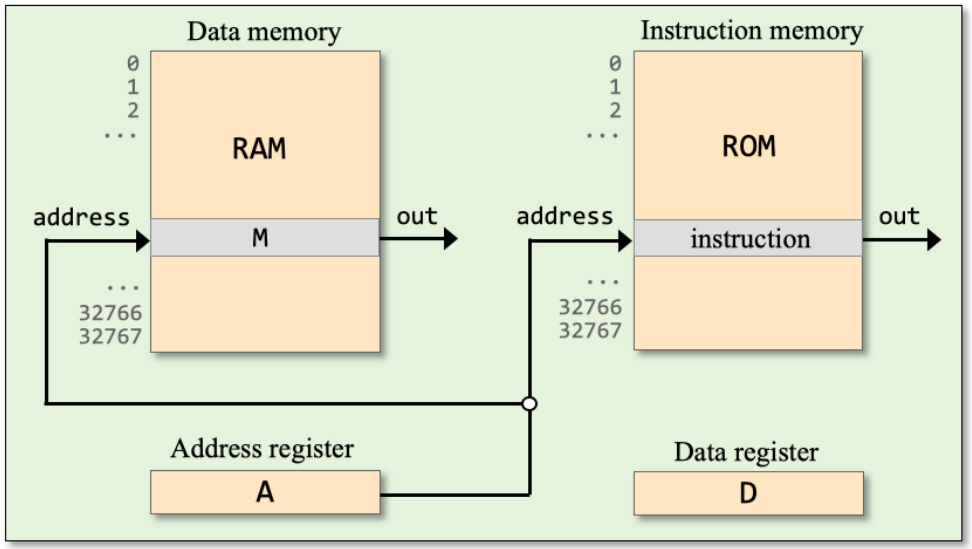


Executing a program



- The default: Execute the next instruction
- Suppose we wish to execute another instruction
- How to specify *branching*?

Branching



Unconditional branching example (pseudocode)

```
0   instruction
1   instruction
2   instruction
3   instruction
4   goto 7
5   instruction
6   instruction
7   instruction
8   instruction
9   goto 2
10  instruction
11  ...
```

Flow of control:

0,1,2,3,4,

7,8,9,

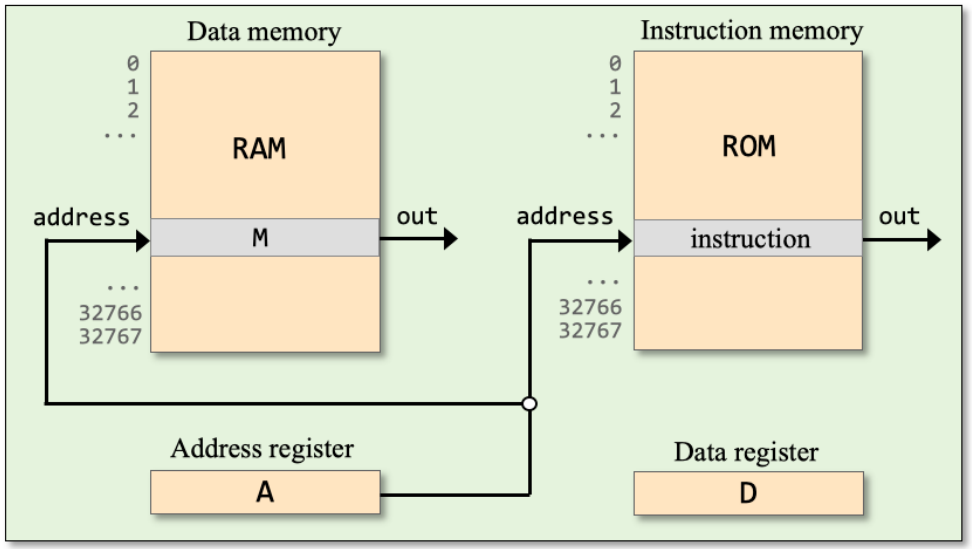
2,3,4,

7,8,9,

2,3,4,

...

Branching



Conditional branching example (pseudocode)

```
0    instruction
1    instruction
2    instruction
3    instruction
4    if (condition) goto 7
5    instruction
6    instruction
7    instruction
8    instruction
9    instruction
...  ...
```

Flow of control:

0,1,2,3,4,

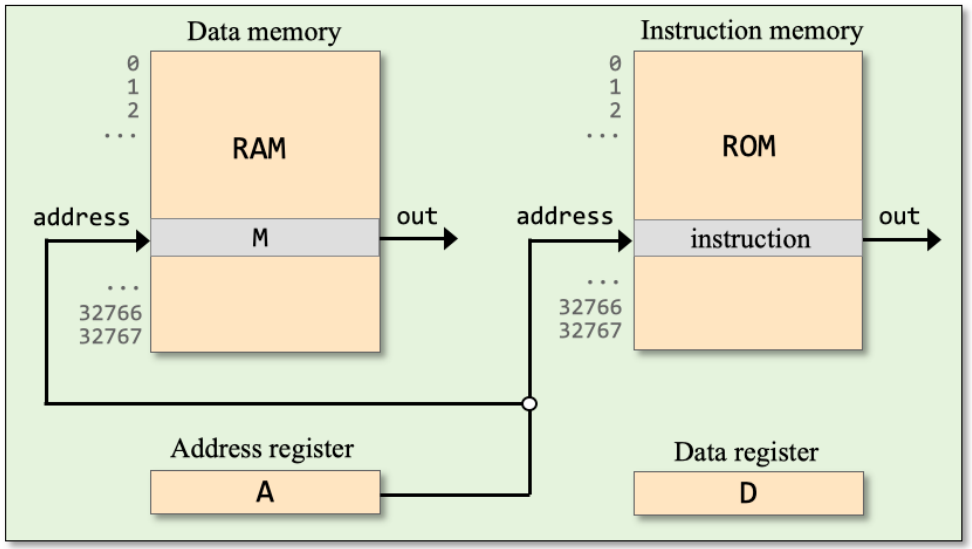
if *condition* is true

7,8,9,...

else

5,6,7,8,9,...

Branching



Branching in the Hack language:

Example (Pseudocode):

```
0    instruction
1    instruction
2    goto 6
3    instruction
4    instruction
5    instruction
6    instruction
7    instruction
...  ...
```

In Hack:

```
...
// goto 6
@6
0;JMP
...
```

- Use an `A`-instruction to select an address
- Jump to that address

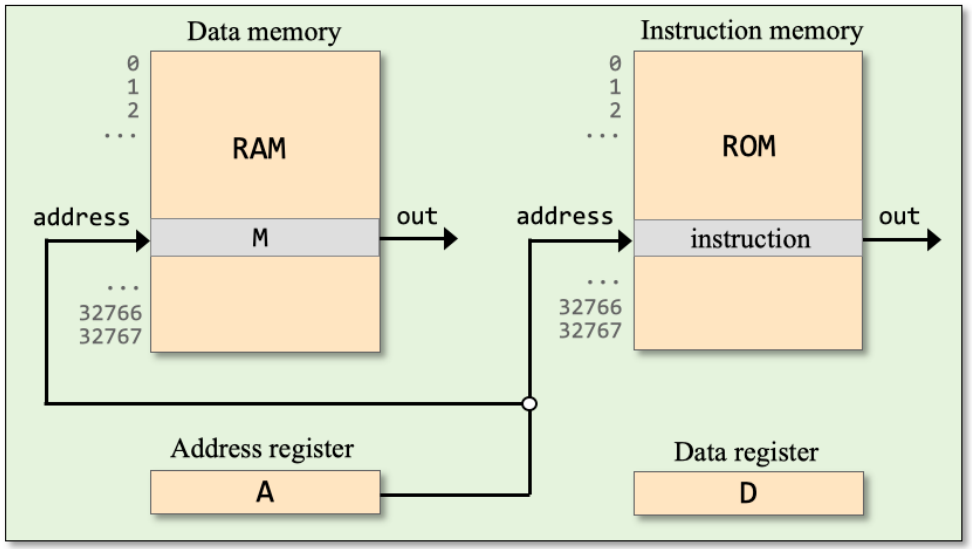
Semantics of `0;JMP`

Jump to execute the instruction stored in `ROM[A]`

(the `0;` prefix is a meaningless syntax convention)

Branching

Branching in the Hack language:



Example (Pseudocode):

```
0    instruction
1    instruction
2    if (D>0) goto 6
3    instruction
4    instruction
5    instruction
6    instruction
7    instruction
...  ...
```

In Hack:

```
...
// if (D>0) goto 6
@6
D;JGT
...
```

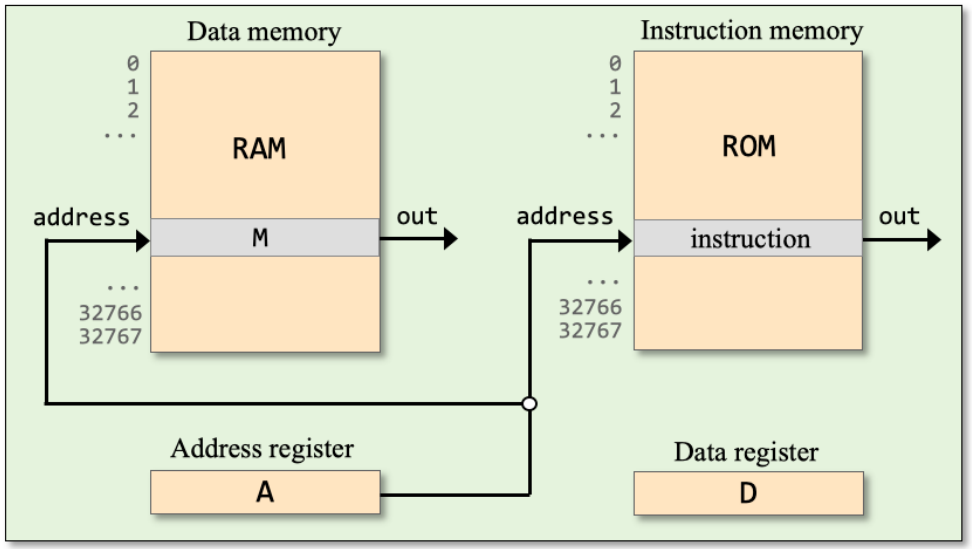
Typical branching instructions:

`D;JGT` // if `D > 0` jump

} to the instruction stored in `ROM[A]`

Branching

Branching in the Hack language:



Example (Pseudocode):

```
0    instruction
1    instruction
2    if (D>0) goto 6
3    instruction
4    instruction
5    instruction
6    instruction
7    instruction
...  ...
```

In Hack:

```
...
// if (D>0) goto 6
@6
D;JGT
...
```

Typical branching instructions:

```
D;JGT  // if D > 0 jump
D;JGE  // if D ≥ 0 jump
D;JLT  // if D < 0 jump
D;JLE  // if D ≤ 0 jump
D;JEQ  // if D = 0 jump
D;JNE  // if D ≠ 0 jump
0;JMP  // jump
```

} to the instruction stored in `ROM[A]`

Branching

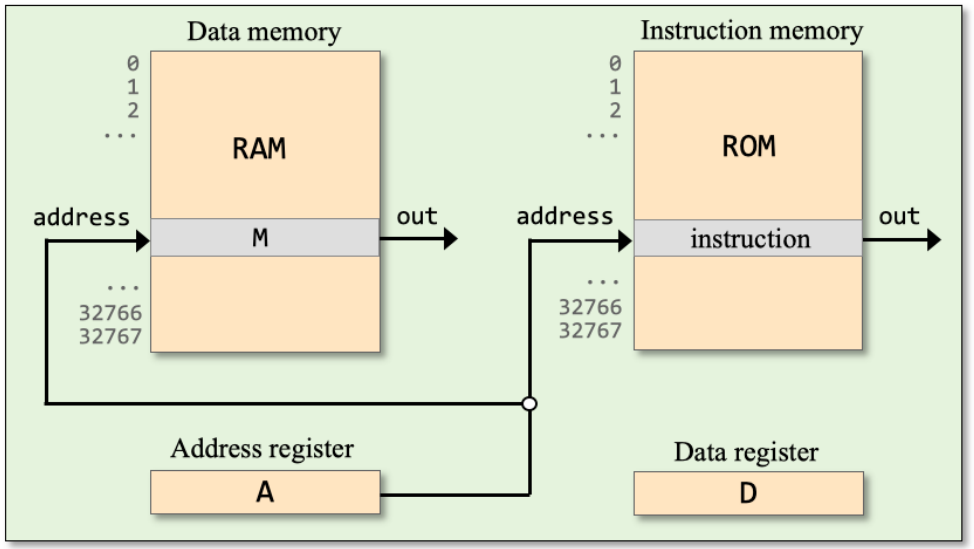
Typical instructions:

`@`*constant* (A ← *constant*)

```
A=1
D=-1
M=0
...
```

```
A=M
D=A
M=D
...
```

```
D=D-A
A=A-1
M=D+1
...
```



```
// if (D = 0) goto 300
```

?

Typical branching instructions:

```
D;JGT  // if D > 0 jump
D;JGE  // if D ≥ 0 jump
D;JLT  // if D < 0 jump
D;JLE  // if D ≤ 0 jump
D;JEQ  // if D = 0 jump
D;JNE  // if D ≠ 0 jump
0;JMP  // jump
```

to the instruction stored in `ROM[A]`

Use only the instructions shown in this slide

Branching

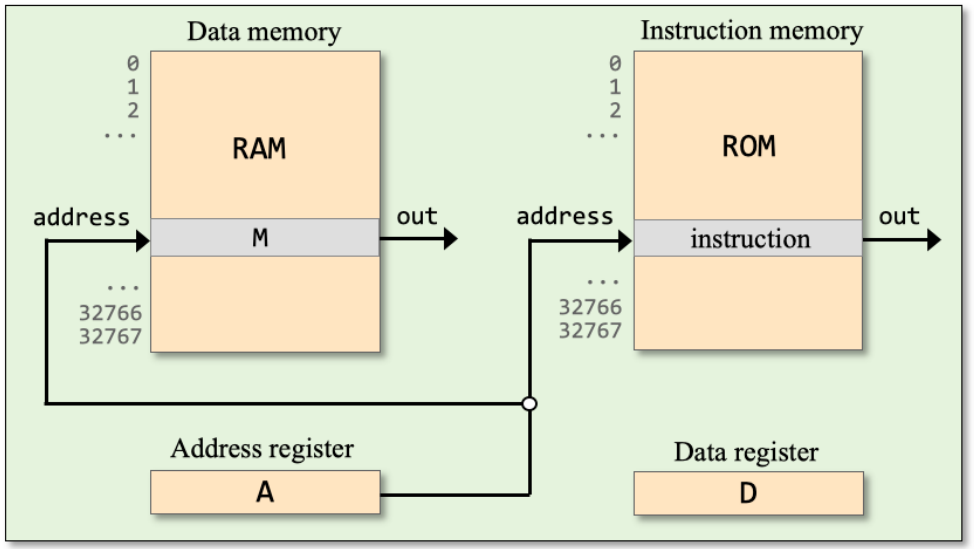
Typical instructions:

`@constant` (A ← *constant*)

```
A=1
D=-1
M=0
...
```

```
A=M
D=A
M=D
...
```

```
D=D-A
A=A-1
M=D+1
...
```



```
// if (D = 0) goto 300
@300
D;JEQ
```

Typical branching instructions:

```
D;JGT  // if D > 0 jump
D;JGE  // if D ≥ 0 jump
D;JLT  // if D < 0 jump
D;JLE  // if D ≤ 0 jump
D;JEQ  // if D = 0 jump
D;JNE  // if D ≠ 0 jump
0;JMP  // jump
```

to the instruction stored in `ROM[A]`

Use only the instructions shown in this slide

Branching

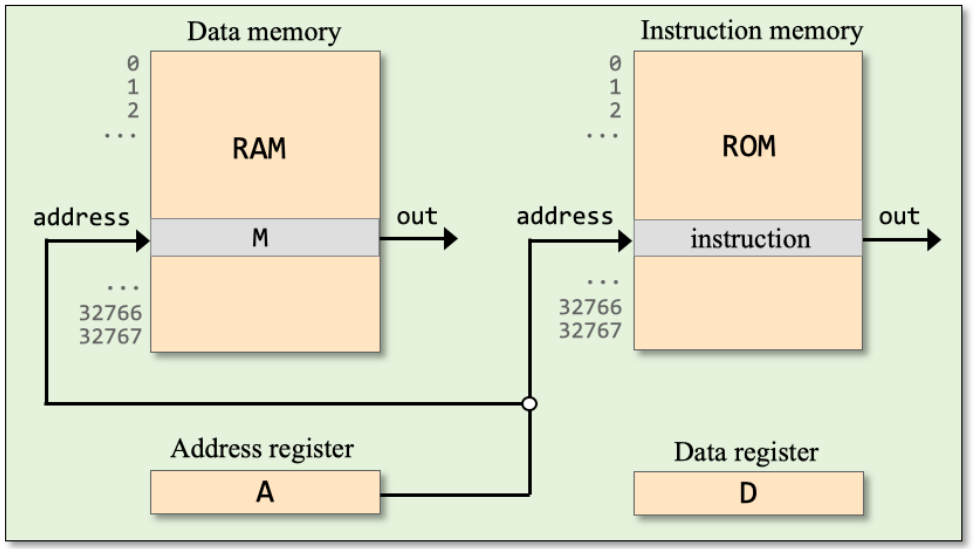
Typical instructions:

`@`*constant* (A ← *constant*)

```
A=1
D=-1
M=0
...
```

```
A=M
D=A
M=D
...
```

```
D=D-A
A=A-1
M=D+1
...
```



```
// if (RAM[3] < 100) goto 12
?
```

Typical branching instructions:

```
D;JGT  // if D > 0 jump
D;JGE  // if D ≥ 0 jump
D;JLT  // if D < 0 jump
D;JLE  // if D ≤ 0 jump
D;JEQ  // if D = 0 jump
D;JNE  // if D ≠ 0 jump
0;JMP  // jump
```

to the instruction stored in `ROM[A]`

Use only the instructions shown in this slide

Branching

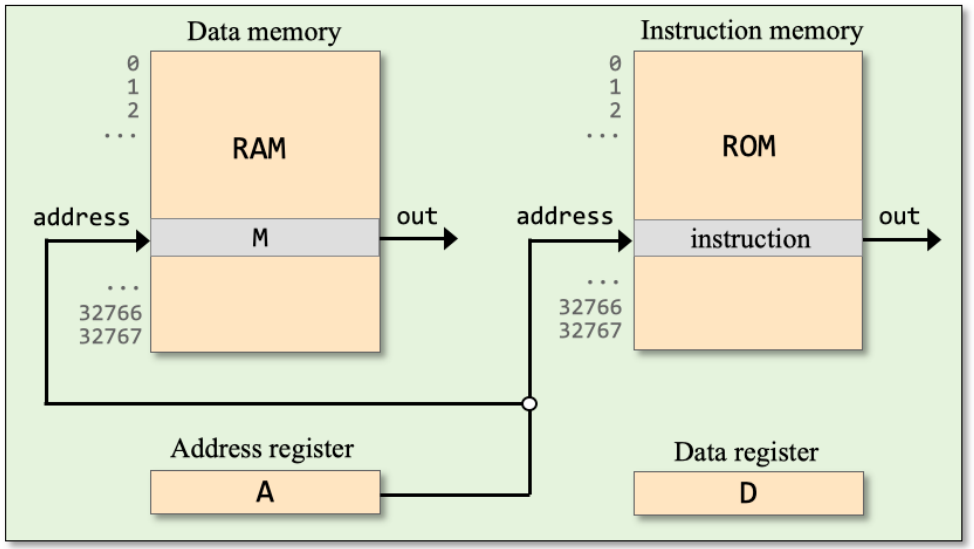
Typical instructions:

`@constant` (A ← *constant*)

```
A=1
D=-1
M=0
...
```

```
A=M
D=A
M=D
...
```

```
D=D-A
A=A-1
M=D+1
...
```



```
// if (RAM[3] < 100) goto 12
// D = RAM[3] - 100
@3
D=M
@100
D=D-A
// if (D < 0) goto 12
@12
D;JLT
```

Typical branching instructions:

```
D;JGT  // if D > 0 jump
D;JGE  // if D ≥ 0 jump
D;JLT  // if D < 0 jump
D;JLE  // if D ≤ 0 jump
D;JEQ  // if D = 0 jump
D;JNE  // if D ≠ 0 jump
0;JMP  // jump
```

to the instruction stored in `ROM[A]`

Use only the instructions shown in this slide

Machine Language

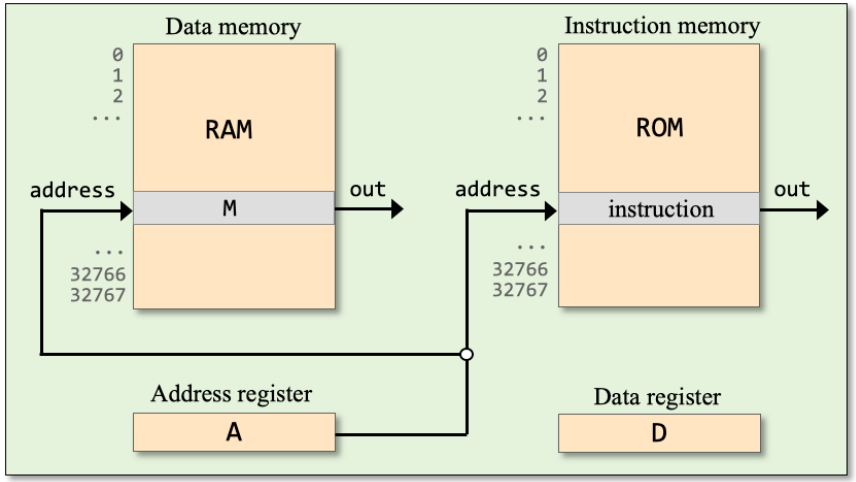
- Project 4

Hack instructions (review)

- A - instruction
- C - instruction



Syntax:

`@xxx`

where *xxx* is either a constant, or a symbol bound to a constant

Examples:

`@19`

Semantics:

A ← 19

`@sym`

A ← the number that `sym` is bound to

This idiom can be used for realizing:

- Variables
- Labels

Variables

Pseudocode (example)

```
...
i = 1
sum = 0
...
sum = sum + i
i = i + 1
...
```

write

Hack assembly

```
...
// i = 1
```

Variables

Pseudocode (example)

```
...
i = 1
sum = 0
...
sum = sum + i
i = i + 1
...
```

write

Hack assembly

```
...
// i = 1
@i
M=1
// sum = 0
@sum
M=0
...
// sum = sum + i
@i
D=M
@sum
M=D+M
// i = i + 1
@i
M=M+1
...
```

Symbolic programming

- The code writer is allowed to create and use symbolic variables, as needed
- We assume that there is an agent who knows how to bind these symbols to sensible RAM addresses

  This agent is the *assembler*

For example

- If the assembler will bind `i` to 16 and `sum` to 17, every instruction `@i` and `@sum` will end up selecting `RAM[16]` and `RAM[17]`
- Invisible to the code writer
- The result: a powerful, low-level, *variables* abstraction.

Variables

Typical instructions:

`@`*constant* A ← *constant*

`@`*symbol* A ← the constant which is bound to *symbol*

```
D=0
M=1
D=-1
M=0
...
```

```
D=M
A=M
M=D
D=A
...
```

```
D=D+A
D=A+1
D=D+M
M=M-1
...
```

```
// sum = 0
?
```

```
// x = 512
?
```

```
// n = n - 1
?
```

```
// sum = sum + x
?
```

Using only the instructions shown above

Variables

Typical instructions:

`@`*constant* A ← *constant*

`@`*symbol* A ← the constant which is bound to *symbol*

```
D=0
M=1
D=-1
M=0
...
```

```
D=M
A=M
M=D
D=A
...
```

```
D=D+A
D=A+1
D=D+M
M=M-1
...
```

```
// sum = 0
@sum
M=0
```

```
// x = 512
@512
D=A
@x
M=D
```

```
// n = n - 1
@n
M=M-1
```

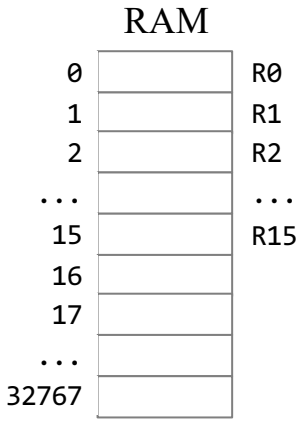
```
// sum = sum + x
@sum
D=M
@x
D=D+M
@sum
M=D
```

Using only the instructions shown above

Variables

Pre-defined symbols in the Hack language

symbol	value
R0	0
R1	1
R2	2
...	...
R15	15



As if we have 16 built-in variables named `R0`…`R15`

We sometimes call them "virtual registers"

Example:

```
// Sets R1 to 2 * R0
// Usage: Enter a value in R0
@R0
D=M
@R1
M=D
M=D+M
```

The use of `R0`, `R1`, … (instead of physical addresses `0`, `1`, …) makes Hack code easier to document, write, and debug.

Machine Language

Overview

- Machine language
- The Hack computer
- The Hack instruction set
- The Hack CPU Emulator

Low Level Programming

- Basic
- Iteration
- Pointers

Symbolic programming

- ✓ Control
- ✓ Variables
- → Labels

The Hack Language

- Symbolic
- Binary
- Output
- Input
- Project 4

Labels

Example (pseudocode)

```
    i = 1000
LOOP:
    if (i = 0) goto CONT
    i = i - 1
    goto LOOP
CONT:
    ...
```

write

Hack assembly

```
    // i = 1000
    @1000
    D=A
    @i
    M=D
(LOOP)
    // if (i = 0) goto CONT
    @i
    D=M
    @CONT
    D;JEQ
    // i = i - 1
    @i
    M=M-1
    // goto LOOP
    @LOOP
    0;JMP
(CONT)
    ...
```

Hack assembly syntax

Label declaration: **(***sym***)**

Binds *sym* to the address of the next instruction

In this example:

`LOOP` is bound to 4

`CONT` is bound to 12

(done by the assembler, and we don't really care about these numbers)

Machine Language

Overview

- Machine language
- The Hack computer
- The Hack instruction set
- The Hack CPU Emulator

Low Level Programming

- Basic
- Iteration
- Pointers

Symbolic programming

- Control
- Variables
- Labels

The Hack Language

- Symbolic
- Binary
- Output
- Input
- Project 4

Program example 1: Add

Add.asm

```
// Sets R2 to R0 + R1 + 17
// D = R0
@R0
D=M
// D = D + R1
@R1
D=D+M
// D = D + 17
@17
D=D+A
// R2 = D
@R2
M=D
```

Program example 2: Signum

Pseudocode

```
// if R0 >= 0 then R1 = 1
// else R1 = -1
   if (R0 ≥ 0) goto POS
   R1 = -1
   goto END
POS:
   R1 = 1
END:
```

write

Signum.asm

```
// if R0 >= 0 then R1 = 1
// else R1 = -1
      // if R0 >= 0 goto POS
      @R0
      D=M
      @POS
      D;JGE
      // R1 = -1
      @R1
      M=-1
      // goto END
      @END
      0;JMP
(POS)
      // R1 = 1
      @R1
      M=1
(END)
```

Best practice

When writing a (non-trivial) assembly program, start by writing pseudocode;

Then translate the pseudo instructions into assembly.

Program translation

Pseudocode

```
// if R0 >= 0 then R1 = 1
// else R1 = -1
   if (R0 ≥ 0) goto POS
   R1 = -1
   goto END
POS:
   R1 = 1
END:
```

Signum.asm

```
// if R0 >= 0 then R1 = 1
// else R1 = -1
      // if R0 >= 0 goto POS
      @R0
      D=M
      @POS
      D;JGE
      // R1 = -1
      @R1
      M=-1
      // goto END
      @END
      0;JMP
(POS)
      // R1 = 1
      @R1
      M=1
(END)
```

The assembler replaces all the symbols with physical addresses

Assembler / loader

(the assembler generates binary instructions; Here we show their symbolic versions, for readability)

Memory

0	@0
1	D=M
2	@8
3	D;JGE
4	@1
5	M=-1
6	@10
7	0;JMP
8	@1
9	M=1
10	
11	
12	
13	
14	
...	

Watch out for loose ends

Pseudocode

```
// if R0 >= 0 then R1 = 1
// else R1 = -1
   if (R0 ≥ 0) goto POS
   R1 = -1
   goto END
POS:
   R1 = 1
END:
```

Signum.asm

```
// if R0 >= 0 then R1 = 1
// else R1 = -1
      // if R0 >= 0 goto POS
      @R0
      D=M
      @POS
      D;JGE
      // R1 = -1
      @R1
      M=-1
      // goto END
      @END
      0;JMP
(POS)
      // R1 = 1
      @R1
      M=1
(END)
```

Memory

0	@0
1	D=M
2	@8
3	D;JGE
4	@1
5	M=-1
6	@10
7	0;JMP
8	@1
9	M=1
10	
11	
12	
13	
14	
...	

Watch out for loose ends

Pseudocode

```
// if R0 >= 0 then R1 = 1
// else R1 = -1
   if (R0 ≥ 0) goto POS
   R1 = -1
   goto END
POS:
   R1 = 1
END:
```

Signum.asm

```
// if R0 >= 0 then R1 = 1
// else R1 = -1
    // if R0 >= 0 goto POS
    @R0
    D=M
    @POS
    D;JGE
    // R1 = -1
    @R1
    M=-1
    // goto END
    @END
    0;JMP
(POS)
    // R1 = 1
    @R1
    M=1
(END)
```

Memory

0	@0
1	D=M
2	@8
3	D;JGE
4	@1
5	M=-1
6	@10
7	0;JMP
8	@1
9	M=1

Pseudocode

```
// if R0 >= 0 then R1 = 1
// else R1 = -1
   if (R0 ≥ 0) goto POS
   R1 = -1
   goto END
POS:
   R1 = 1
END:
```

Signum.asm

```
// if R0 >= 0 then R1 = 1
// else R1 = -1
    // if R0 >= 0 goto POS
    @R0
    D=M
    @POS
    D;JGE
    // R1 = -1
    @R1
    M=-1
    // goto END
    @END
    0;JMP
(POS)
    // R1 = 1
    @R1
    M=1
(END)
    @END
    0;JMP
```

Memory

0	@0
1	D=M
2	@8
3	D;JGE
4	@1
5	M=-1
6	@10
7	0;JMP
8	@1
9	M=1
10	@10
11	0;JMP
12	0100100110011011
13	1110010011111111
14	0101011100110111
...	

Best practice

Terminate every assembly program with an infinite loop.

By the way…

Pseudocode

```
// if R0 >= 0 then R1 = 1
// else R1 = -1
   if (R0 ≥ 0) goto POS
   R1 = -1
   goto END
POS:
   R1 = 1
END:
```

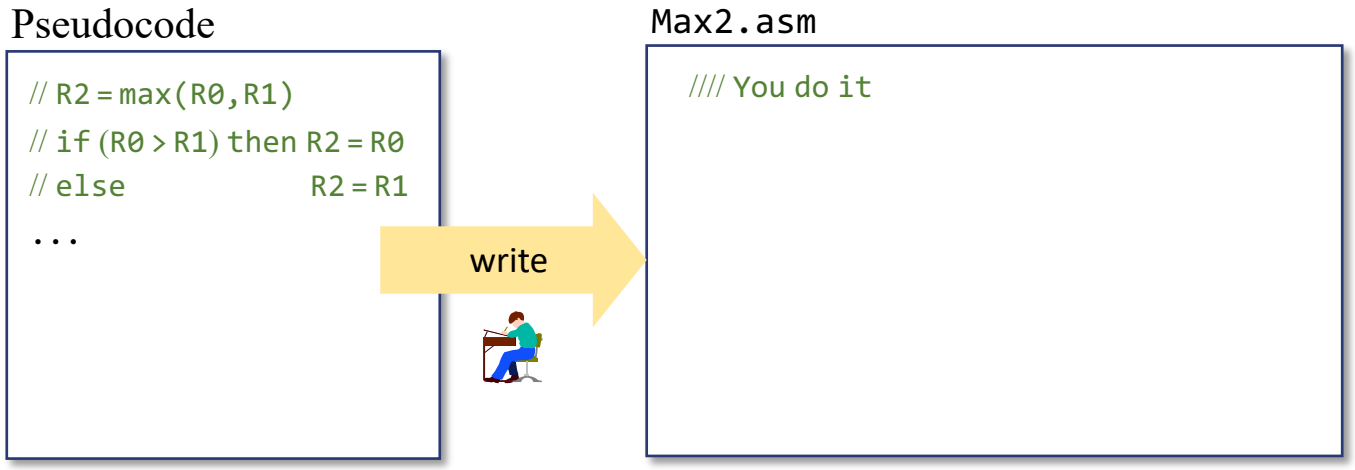
Better:

```
// if R0 >= 0 then R1 = 1
// else R1 = -1
   R1 = -1
   if (R0 < 0) goto END
   R1 = 1
END:
```

Best practice

Optimize your pseudocode before writing it in machine language.

Program example 3: Max



- Start by writing the pseudocode
- Write the assembly code in a text file named `Max2.asm`
- Load `Max2.asm` into the CPU emulator
- Put some values in `R0` and `R1`
- Run the program, one instruction at a time
- Inspect the result, `R2`.

Machine Language

Overview

- Machine language
- The Hack computer
- The Hack instruction set
- The Hack CPU Emulator

Low Level Programming

- ✓ Basic
- → Iteration
- Pointers

Symbolic programming

- Control
- Variables
- Labels

The Hack Language

- Symbolic
- Binary
- Output
- Input
- Project 4

Iterative processing

Example: Compute $1 + 2 + 3 + ... + N$

Pseudocode

```
// Program: Sum1ToN (R0 represents N)
// Computes R1 = 1 + 2 + 3 + ... + R0
// Usage: put a value >= 1 in R0
   i = 1
   sum = 0
LOOP:
   if (i > R0) goto STOP
   sum = sum + i
   i = i + 1
   goto LOOP
STOP:
   R1 = sum
```

Iterative processing

Example: Compute $1 + 2 + 3 + ... + N$

Pseudocode

```
// Program: Sum1ToN (R0 represents N)
// Computes R1 = 1 + 2 + 3 + ... + R0
// Usage: put a value >= 1 in R0
   i = 1
   sum = 0
LOOP:
   if (i > R0) goto STOP
   sum = sum + i
   i = i + 1
   goto LOOP
STOP:
   R1 = sum
```

Hack assembly

```
// Program: Sum1ToN (R0 represents N)
// Computes R1 = 1 + 2 + 3 + ... + R0
// Usage: put a value >= 1 in R0
   // i = 1
   @i
   M=1
   // sum = 0
   @sum
   M=0
(LOOP)
   // if (i > R0) goto STOP
   @i
   D=M
   @R0
   D=D-M
   @STOP
   D;JGT
   // sum = sum + i
   @sum
   D=M
   @i
   D=D+M
   @sum
   M=D
   // i = i + 1
   @i
   M=M+1
   // goto LOOP
   @LOOP
   0;JMP
```

(code continues here)

```
(STOP)
   // R1 = sum
   @sum
   D=M
   @R1
   M=D
   // infinite loop
(END)
   @END
   0;JMP
```

Machine Language

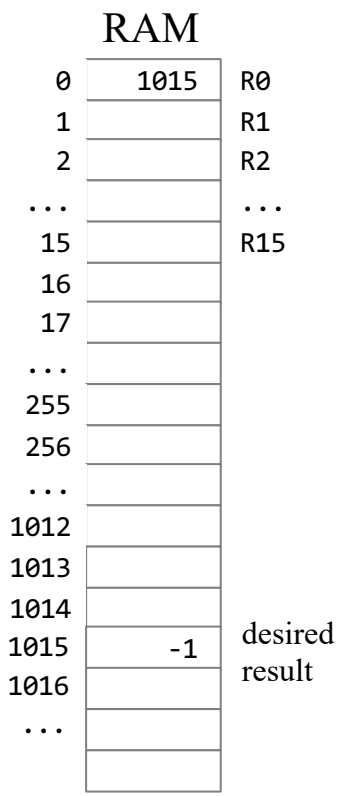
- Output
- Input
- Project 4

Pointer-based processing

Example 1: Set the register at address *addr* to –1

Input: `R0` holds *addr*

```
// Sets RAM[R0] to -1
// Usage: Put some non-negative value in R0
@R0
A=M
M=-1
```



example:
addr = 1015

In Hack, pointer-based access is realized by setting the address register to the address that we want to access, using the instruction:

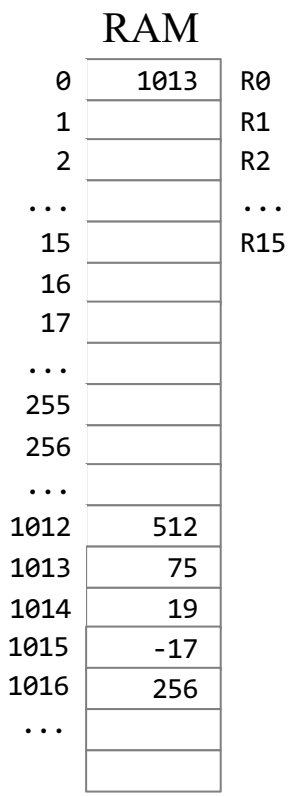
`A = ...`

Pointer-based processing

Example 2: Get the value of the register at address *addr*

Input: `R0` holds *addr*

```
// Gets R1 = RAM[R0]
// Usage: Put some non-negative value in R0
```



example:
addr = 1013

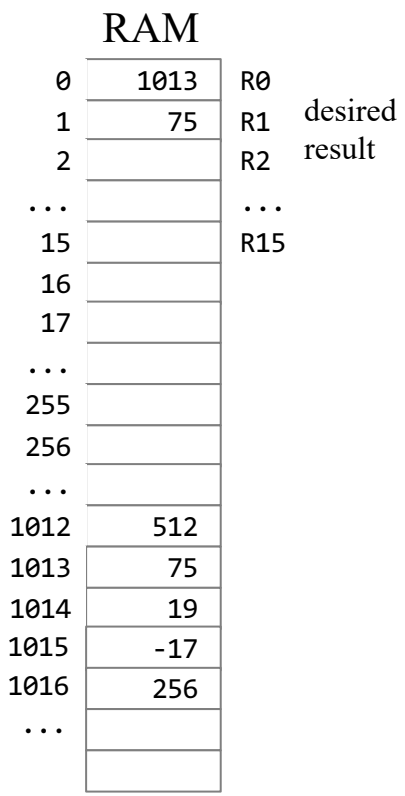
Pointer-based processing

Example 2: Get the value of the register at address *addr*

Input: `R0` holds *addr*

```
// Gets R1 = RAM[R0]
// Usage: Put some non-negative value in R0

?
```



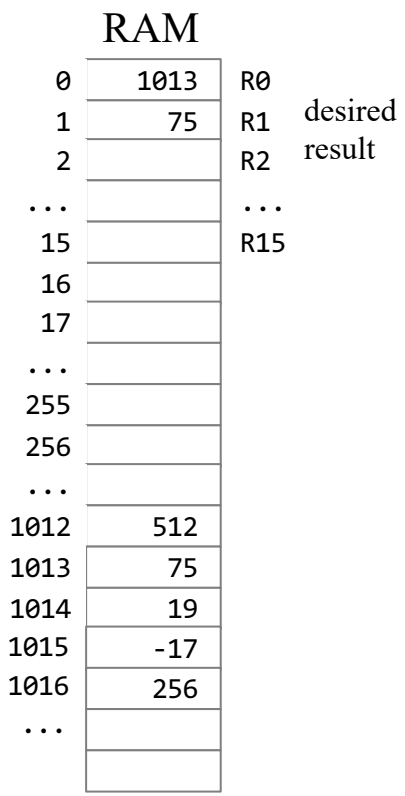
example:
addr = 1013

Pointer-based processing

Example 2: Get the value of the register at address *addr*

Input: `R0` holds *addr*

```
// Gets R1 = RAM[R0]
// Usage: Put some non-negative value in R0
@R0
A=M
D=M
@R1
M=D
```

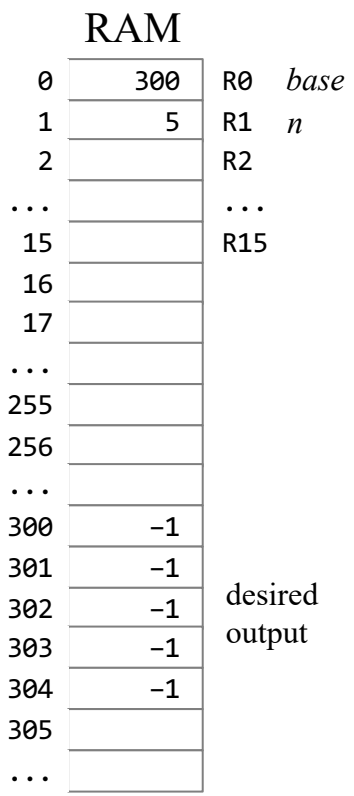


example:
addr = 1013

Pointer-based processing

Example 3: Set the first *n* words of the memory block beginning in address *base* to `-1`

Inputs: `R0` (*base*) and `R1` (*n*)

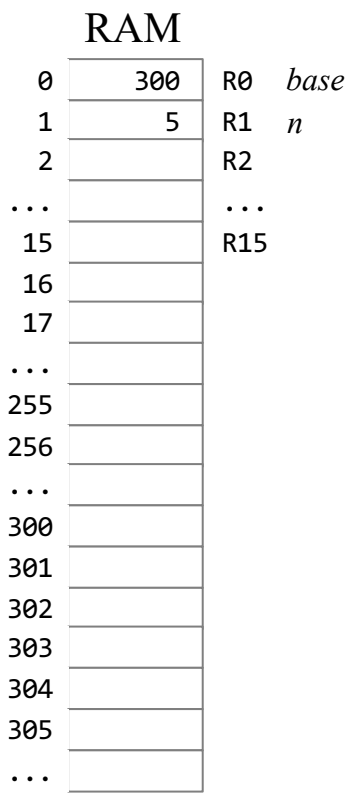


example:
base = 300
n = 5

Pointer-based processing

Example 3: Set the first *n* words of the memory block beginning in address *base* to `-1`

Inputs: `R0` (*base*) and `R1` (*n*)

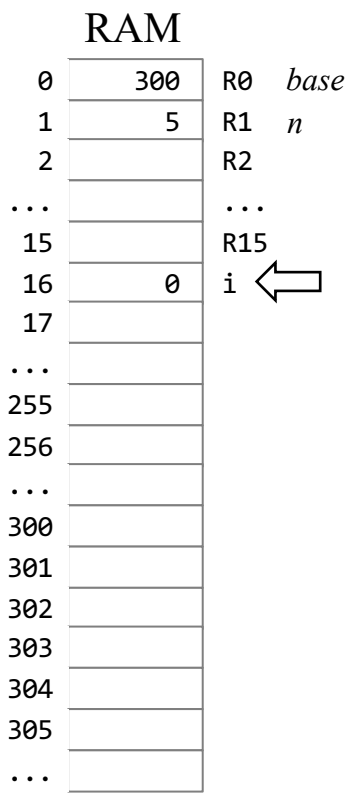


example:
base = 300
n = 5

Pointer-based processing

Example 3: Set the first *n* words of the memory block beginning in address *base* to `-1`

Inputs: `R0` (*base*) and `R1` (*n*)

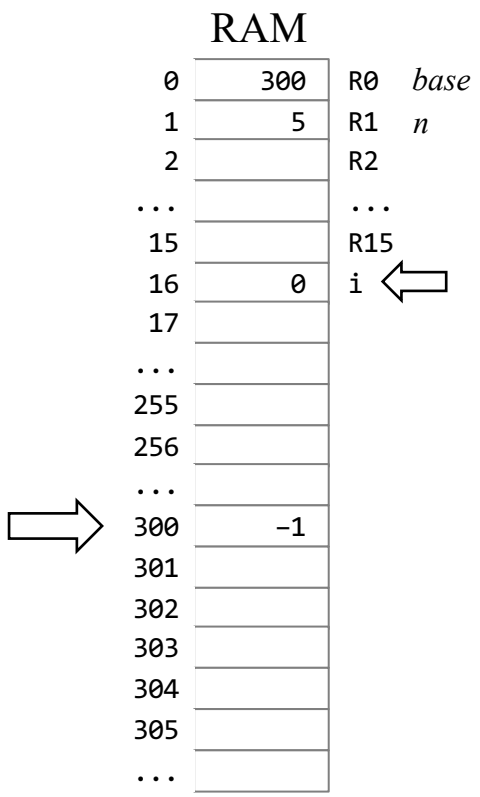


example:
base = 300
n = 5

Pointer-based processing

Example 3: Set the first *n* words of the memory block beginning in address *base* to `-1`

Inputs: `R0` (*base*) and `R1` (*n*)

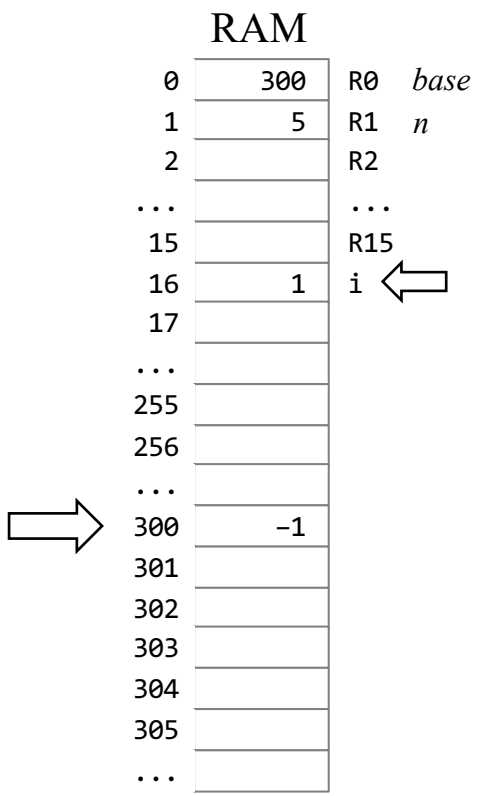


example:
base = 300
n = 5

Pointer-based processing

Example 3: Set the first *n* words of the memory block beginning in address *base* to `-1`

Inputs: `R0` (*base*) and `R1` (*n*)

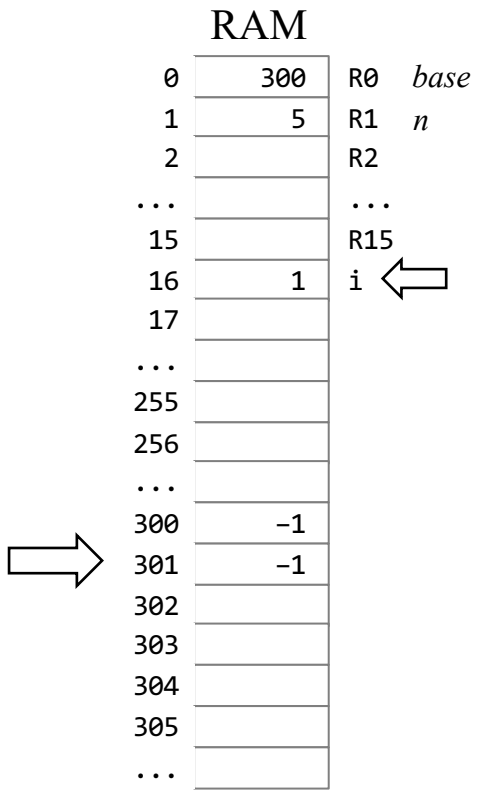


example:
base = 300
n = 5

Pointer-based processing

Example 3: Set the first *n* words of the memory block beginning in address *base* to `-1`

Inputs: `R0` (*base*) and `R1` (*n*)

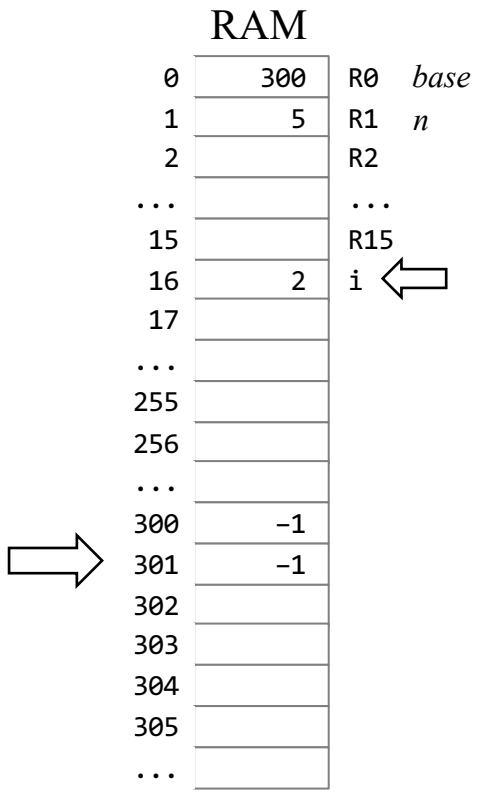


example:
base = 300
n = 5

Pointer-based processing

Example 3: Set the first *n* words of the memory block beginning in address *base* to `-1`

Inputs: `R0` (*base*) and `R1` (*n*)

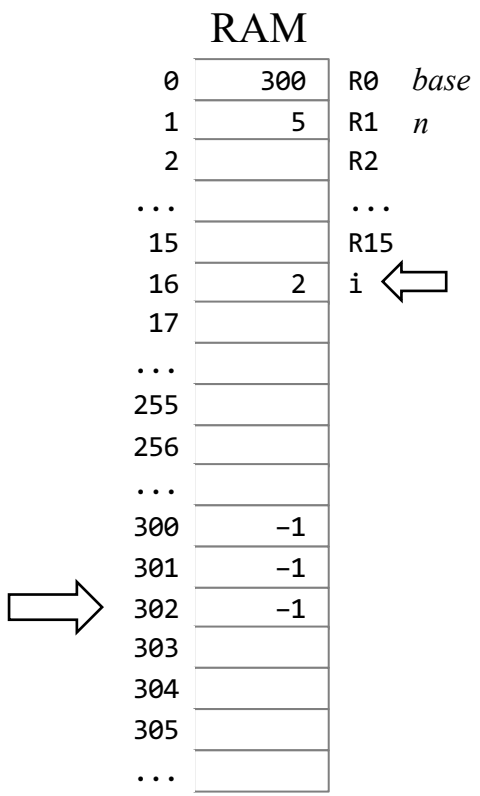


example:
base = 300
n = 5

Pointer-based processing

Example 3: Set the first *n* words of the memory block beginning in address *base* to `-1`

Inputs: `R0` (*base*) and `R1` (*n*)

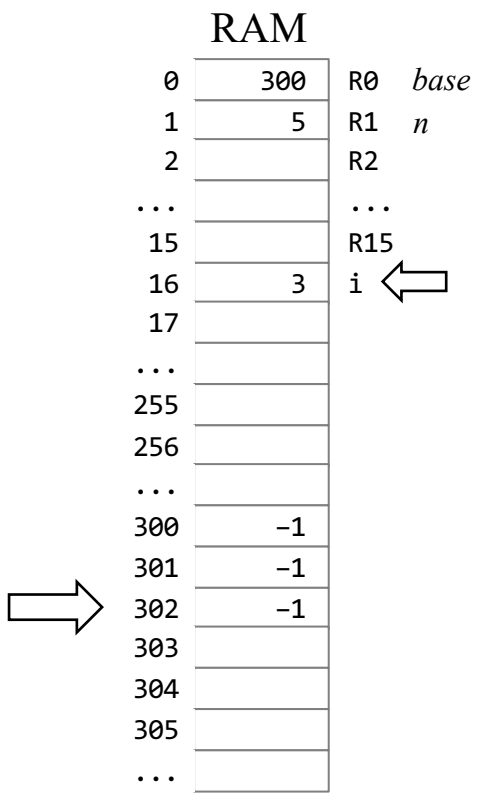


example:
base = 300
n = 5

Pointer-based processing

Example 3: Set the first *n* words of the memory block beginning in address *base* to `-1`

Inputs: `R0` (*base*) and `R1` (*n*)

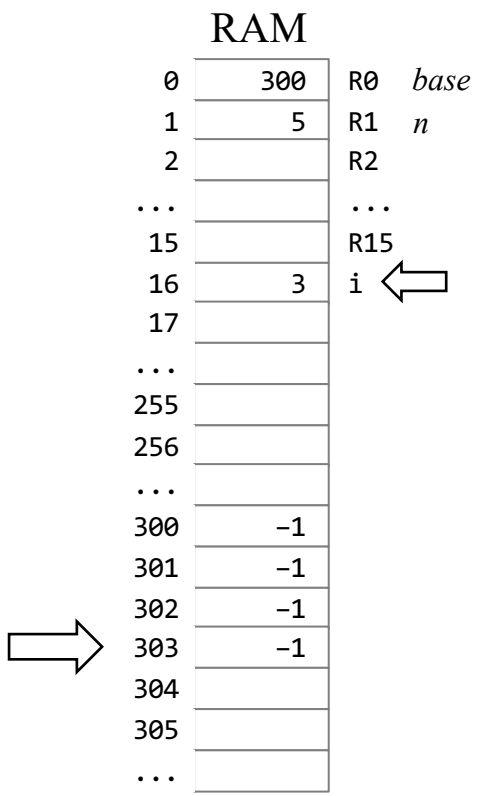


example:
base = 300
n = 5

Pointer-based processing

Example 3: Set the first *n* words of the memory block beginning in address *base* to `-1`

Inputs: `R0` (*base*) and `R1` (*n*)

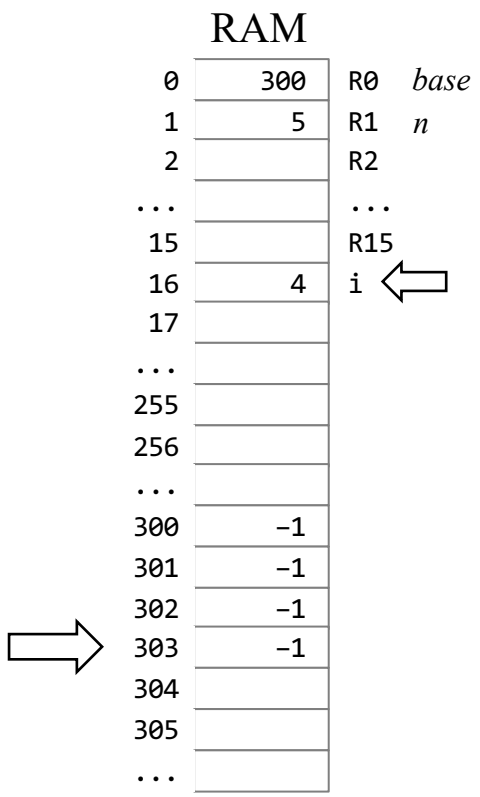


example:
base = 300
n = 5

Pointer-based processing

Example 3: Set the first *n* words of the memory block beginning in address *base* to `-1`

Inputs: `R0` (*base*) and `R1` (*n*)

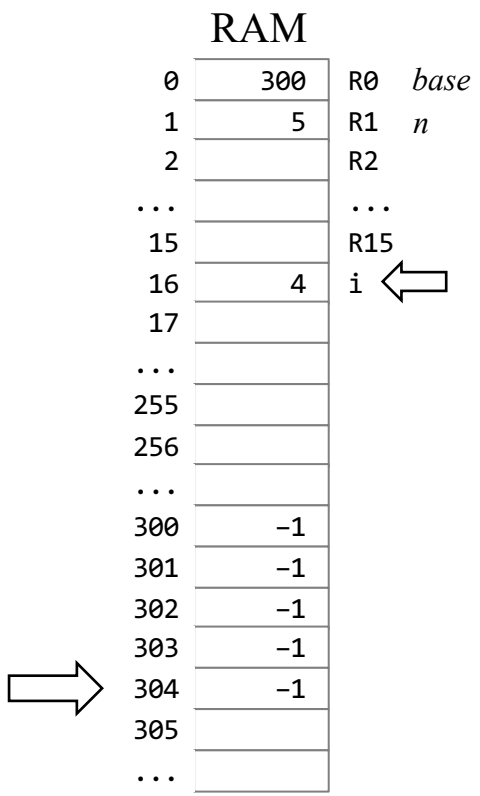


example:
base = 300
n = 5

Pointer-based processing

Example 3: Set the first *n* words of the memory block beginning in address *base* to `-1`

Inputs: `R0` (*base*) and `R1` (*n*)

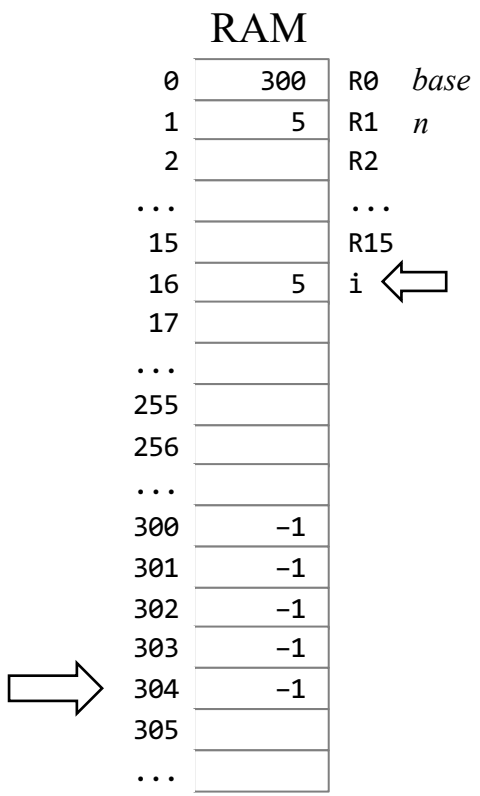


example:
base = 300
n = 5

Pointer-based processing

Example 3: Set the first *n* words of the memory block beginning in address *base* to `-1`

Inputs: `R0` (*base*) and `R1` (*n*)



example:
base = 300
n = 5

Pointer-based processing

Example 3: Set the first *n* words of the memory block beginning in address *base* to `-1`

Inputs: `R0` (*base*) and `R1` (*n*)

Pseudocode

```
// Program: PointerDemo.asm
// Starting at the address stored in R0,
// sets the first R1 words to -1
   i=0
LOOP:
   if (i==R1) goto END
   RAM[R0+i] = -1
   i = i+1
   goto LOOP
END:
```

RAM

0	300	R0	*base*
1	5	R1	*n*
2		R2	
...		...	
15		R15	
16	5	i

300	-1		
301	-1		
302	-1		
303	-1		
304	-1		
305			
...			

example:
base = 300
n = 5

Pointer-based processing

Example 3: Set the first *n* words of the memory block beginning in address *base* to `-1`

Inputs: `R0` (*base*) and `R1` (*n*)

Pseudocode

```
// Program: PointerDemo.asm
// Starting at the address stored in R0,
// sets the first R1 words to -1
    i = 0
LOOP:
    if (i == R1) goto END
    RAM[R0 + i] = -1
    i = i + 1
    goto LOOP
END:
```

Assembly code

```
// Program: PointerDemo.asm
// Starting at the address stored in R0,
// sets the first R1 words to -1
      // i = 0
      @i
      M=0
(LOOP)
      // if (i == R1) goto END
      @i
      D=M
      @R1
      D=D-M
      @END
      D;JEQ
      // RAM[R0 + i] = -1
      @R0
      D=M
      @i
      A=D+M
      M=-1
      // i = i + 1
      @i
      M=M+1
      // goto LOOP
      @LOOP
      0;JMP
(END)
      @END
      0;JMP
```

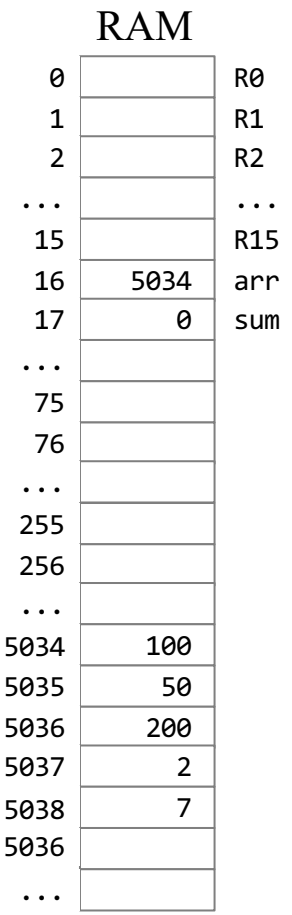
example:
base = 300
n = 5

Array processing

High-level code (Java example)

```
...
// Variable declarations
int[] arr = new int[5];
int sum = 0;
...
// Enters some values into the array
// (code omitted)
...
// Sums up the array elements
for (int j=0; j<5; j++) {
   sum = sum + arr[j];
}
...
```

Memory state just before executing the `for` loop:

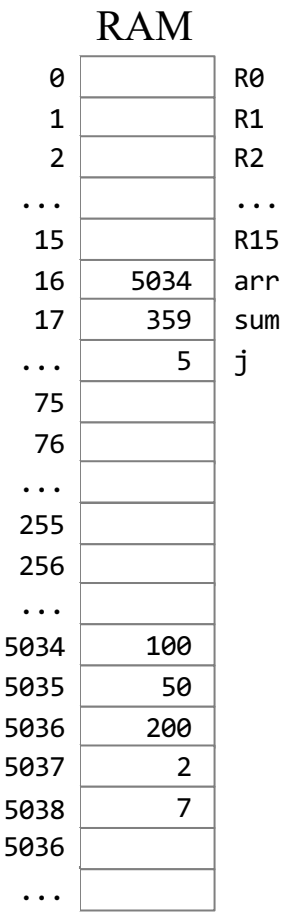


Array processing

High-level code (Java example)

```
...
// Variable declarations
int[] arr = new int[5];
int sum = 0;
...
// Enters some values into the array
// (code omitted)
...
// Sums up the array elements
for (int j=0; j<5; j++) {
   sum = sum + arr[j];
}
...
```

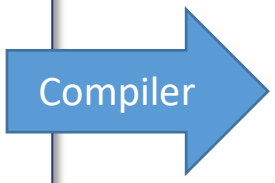
Memory state just after executing the `for` loop:



Array processing

High-level code (Java example)

```
...
// Variable declarations
int[] arr = new int[5];
int sum = 0;
...
// Enters some values into the array
// (code omitted)
...
// Sums up the array elements
for (int j = 0; j < 5; j++) {
   sum = sum + arr[j];
}
...
```



Hack assembly

Every high-level array access *arr*[*expression*] can be compiled into Hack code that realizes the access using the low-level idiom

A = *arr* + *expression*

Machine Language

Overview

- Machine language
- The Hack computer
- The Hack instruction set
- The Hack CPU Emulator

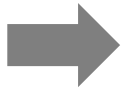
Symbolic programming

- Control
- Variables
- Labels

Low Level Programming

- Basic
- Iteration
- Pointers

The Hack Language

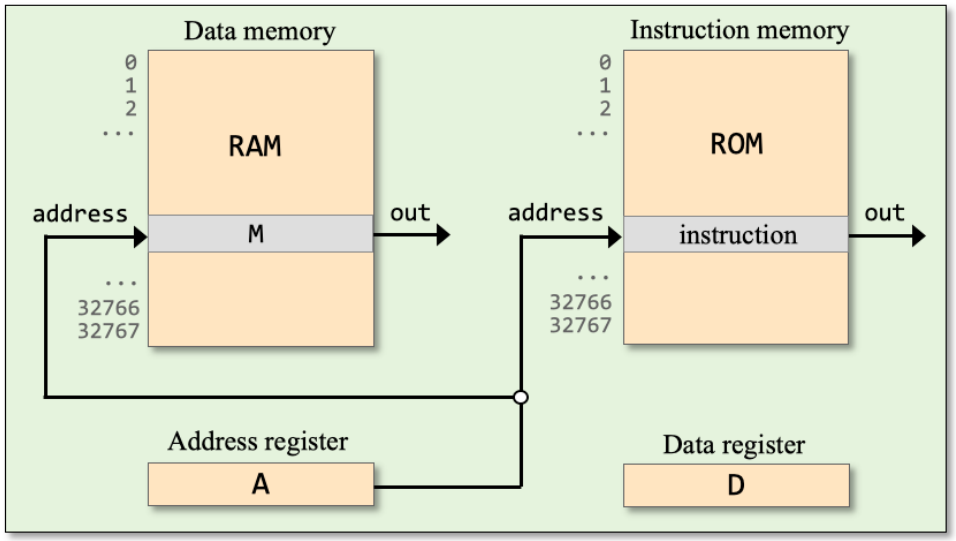


- Symbolic
- Binary
- Output
- Input
- Project 4

The A-instruction

Instruction set

- A - instruction
- C - instruction



Syntax:

`@xxx`

where *xxx* is either a constant, or a symbol bound to a constant

Semantics:

- Sets the `A` register to the *xxx*
- Side effects:

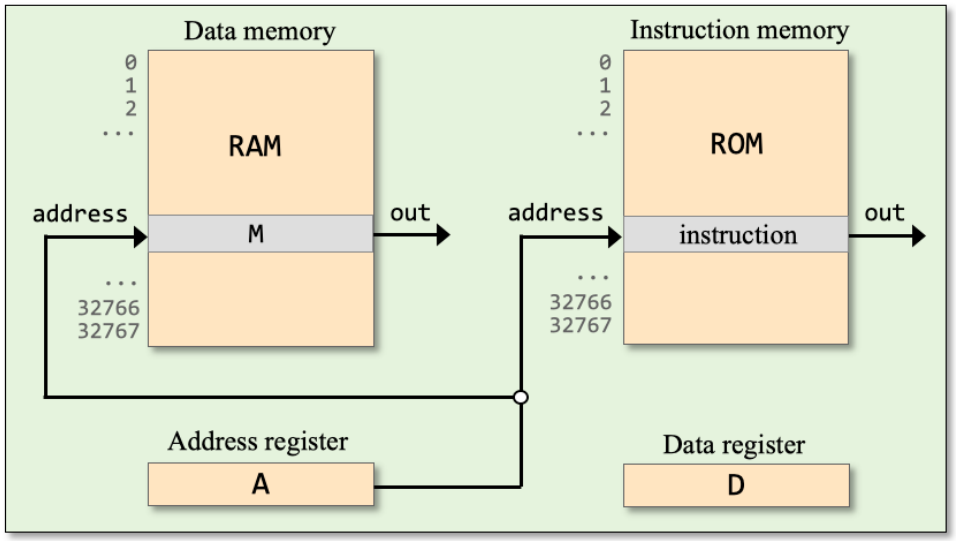
  `RAM[A]` becomes the selected `RAM` location

  `ROM[A]` becomes the selected `ROM` location

The C-instruction

Instruction set

- A - instruction
- C - instruction



The C-instruction

Syntax: *dest* = *comp* ; *jump* "*dest* =" and "; *jump*" are optional

where:

comp =
```
0, 1, -1, D, A, !D, !A, -D, -A, D+1, A+1, D-1, A-1, D+A, D-A, A-D, D&A, D|A
          M,    !M,    -M,    M+1,    M-1, D+M, D-M, M-D, D&M, D|M
```

dest = `null, M, D, DM, A, AM, AD, ADM` `M` stands for `RAM[A]`

jump = `null, JGT, JEQ, JGE, JLT, JNE, JLE, JMP`

Semantics:

Computes the value of *comp* and stores the result in *dest.*

If (*comp jump* `0`), branches to execute `ROM[A]`

The C-instruction

Syntax: *dest* = *comp* ; *jump* "*dest* =" and "; *jump*" are optional

where:

comp =

```
0, 1, -1, D, A, !D, !A, -D, -A, D+1, A+1, D-1, A-1, D+A, D-A, A-D, D&A, D|A
          M,    !M,    -M,   M+1,    M-1, D+M, D-M, M-D, D&M, D|M
```

dest = `null, M, D, DM, A, AM, AD, ADM` `M` stands for `RAM[A]`

jump = `null, JGT, JEQ, JGE, JLT, JNE, JLE, JMP`

Semantics:

Computes the value of *comp* and stores the result in *dest*.

If (*comp jump* `0`), branches to execute `ROM[A]`

Examples:

```
// Sets the D register to -1
```

The C-instruction

Syntax: *dest* = *comp* ; *jump* "*dest* =" and "; *jump*" are optional

where:

comp =

```
0, 1, -1, D, A, !D, !A, -D, -A, D+1, A+1, D-1, A-1, D+A, D-A, A-D, D&A, D|A
          M,    !M,    -M,    M+1,    M-1, D+M, D-M, M-D, D&M, D|M
```

dest = `null, M, D, DM, A, AM, AD, ADM` `M` stands for `RAM[A]`

jump = `null, JGT, JEQ, JGE, JLT, JNE, JLE, JMP`

Semantics:

Computes the value of *comp* and stores the result in *dest*.

If (*comp jump* `0`), branches to execute `ROM[A]`

Examples:

```
// Sets the D register to -1
D=-1
```

The C-instruction

Syntax: *dest* = *comp* ; *jump* "*dest* =" and "; *jump*" are optional

where:

comp =
```
0, 1, -1, D, A, !D, !A, -D, -A, D+1, A+1, D-1, A-1, D+A, D-A, A-D, D&A, D|A
          M,    !M,    -M,    M+1,    M-1, D+M, D-M, M-D, D&M, D|M
```

dest = `null, M, D, DM, A, AM, AD, ADM` `M` stands for `RAM[A]`

jump = `null, JGT, JEQ, JGE, JLT, JNE, JLE, JMP`

Semantics:

Computes the value of *comp* and stores the result in *dest*.

If (*comp jump* `0`), branches to execute `ROM[A]`

Examples:

```
// Sets D and M to the value of the D register, plus 1
```

The C-instruction

Syntax: *dest* = *comp* ; *jump* "*dest* =" and "; *jump*" are optional

where:

comp =
```
0, 1, -1, D, A, !D, !A, -D, -A, D+1, A+1, D-1, A-1, D+A, D-A, A-D, D&A, D|A
          M,    !M,    -M,    M+1,    M-1, D+M, D-M, M-D, D&M, D|M
```

dest = `null, M, D, DM, A, AM, AD, ADM` `M` stands for `RAM[A]`

jump = `null, JGT, JEQ, JGE, JLT, JNE, JLE, JMP`

Semantics:

Computes the value of *comp* and stores the result in *dest*.

If (*comp jump* `0`), branches to execute `ROM[A]`

Examples:

```
// Sets D and M to the value of the D register, plus 1
DM=D+1
```

The C-instruction

Syntax: *dest* = *comp* ; *jump* "*dest* =" and "; *jump*" are optional

where:

comp =

```
0, 1, -1, D, A, !D, !A, -D, -A, D+1, A+1, D-1, A-1, D+A, D-A, A-D, D&A, D|A
          M,    !M,    -M,    M+1,    M-1, D+M, D-M, M-D, D&M, D|M
```

dest = `null, M, D, DM, A, AM, AD, ADM` `M` stands for `RAM[A]`

jump = `null, JGT, JEQ, JGE, JLT, JNE, JLE, JMP`

Semantics:

Computes the value of *comp* and stores the result in *dest*.

If (*comp jump* `0`), branches to execute `ROM[A]`

Examples:

```
// If (D-1 = 0) jumps to execute the instruction stored in ROM[56]
```

The C-instruction

Syntax: *dest* = *comp* ; *jump* "*dest* =" and "; *jump*" are optional

where:

comp =

```
0, 1, -1, D, A, !D, !A, -D, -A, D+1, A+1, D-1, A-1, D+A, D-A, A-D, D&A, D|A
          M,    !M,    -M,    M+1,       M-1, D+M, D-M, M-D, D&M, D|M
```

dest = `null, M, D, DM, A, AM, AD, ADM` `M` stands for `RAM[A]`

jump = `null, JGT, JEQ, JGE, JLT, JNE, JLE, JMP`

Semantics:

Computes the value of *comp* and stores the result in *dest*.

If (*comp jump* `0`), branches to execute `ROM[A]`

Examples:

```
// If (D-1 = 0) jumps to execute the instruction stored in ROM[56]
@56
D-1;JEQ
```

Recap: A-instructions and C-instructions

They normally come in pairs:

```
// RAM[5] = RAM[5] - 1
@5
M=M-1
```

To set up for a C-instruction that operates on `M`,
Use an A-instruction to select the target address

```
// if D=0 goto 100
@100
D;JEQ
```

To set up for a C-instruction that specifies a jump,
Use an A-instruction to select the target address

Note: It makes no sense that a C-instruction will use the same address to access the data memory and the instruction memory simultaneously;

Best practice rule

A C-instruction should specify …

- Either `M`
- Or a jump directive

But not both.

Hack machine language specification

Two versions

✓ Symbolic

➡ Binary

The binary specification is not intended for writing *low-level programs*;
It is intended for writing *assemblers* (chapter 6).

We describe it here, for completeness.

Hack machine language specification

A instruction

Symbolic: `@`*xxx*

Binary: `0` *vvvvvvvvvvvvvvv* (binary value of *xxx*)

Example:

Symbolic: `@6`

Binary: `0000000000000110`

C instruction

Symbolic: *dest* `=` *comp* `;` *jump*

Binary: `111`*accccccdddjjj* (bit fields coding *dest*, *comp*, *jump*)

Example:

Symbolic: `D=D+1;JMP`

Binary: `1111011111010111`

C-instruction

Symbolic syntax: *dest* = *comp* ; *jump*

comp is mandatory.
If *dest* is empty, the = is omitted; If *jump* is empty, the ; is omitted

Binary syntax:

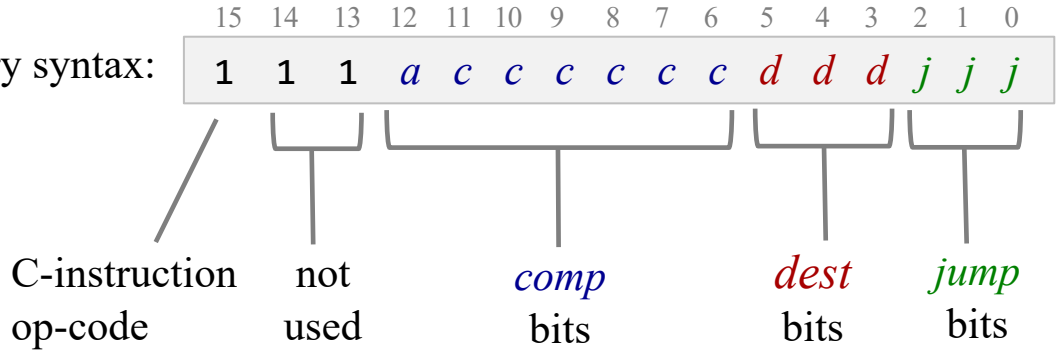
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	*a*	*c*	*c*	*c*	*c*	*c*	*c*	*d*	*d*	*d*	*j*	*j*	*j*

C-instruction

Symbolic syntax: *dest* = *comp* ; *jump*

comp is mandatory.
If *dest* is empty, the = is omitted; If *jump* is empty, the ; is omitted

Binary syntax:



C-instruction

Symbolic syntax: *dest* = *comp* ; *jump*

comp is mandatory.
If *dest* is empty, the = is omitted; If *jump* is empty, the ; is omitted

Binary syntax:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	*a*	*c*	*c*	*c*	*c*	*c*	*c*	*d*	*d*	*d*	*j*	*j*	*j*

comp bits

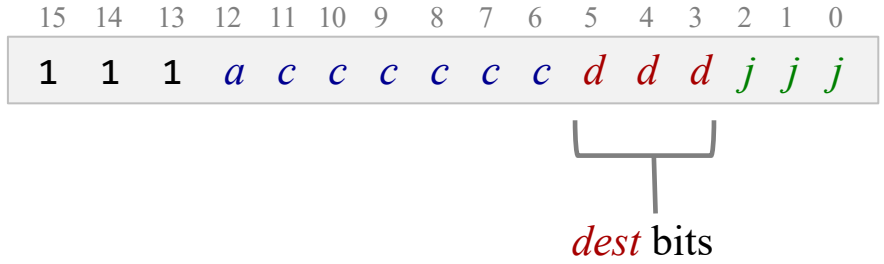
comp		*c*	*c*	*c*	*c*	*c*	*c*
0		1	0	1	0	1	0
1		1	1	1	1	1	1
-1		1	1	1	0	1	0
D		0	0	1	1	0	0
A	M	1	1	0	0	0	0
!D		0	0	1	1	0	1
!A	!M	1	1	0	0	0	1
-D		0	0	1	1	1	1
-A	-M	1	1	0	0	1	1
D+1		0	1	1	1	1	1
A+1	M+1	1	1	0	1	1	1
D-1		0	0	1	1	1	0
A-1	M-1	1	1	0	0	1	0
D+A	D+M	0	0	0	0	1	0
D-A	D-M	0	1	0	0	1	1
A-D	M-D	0	0	0	1	1	1
D&A	D&M	0	0	0	0	0	0
D|A	D|M	0	1	0	1	0	1
a==0	*a*==1						

C-instruction

Symbolic syntax: *dest* `=` *comp* `;` *jump*

comp is mandatory.
If *dest* is empty, the `=` is omitted; If *jump* is empty, the `;` is omitted

Binary syntax:



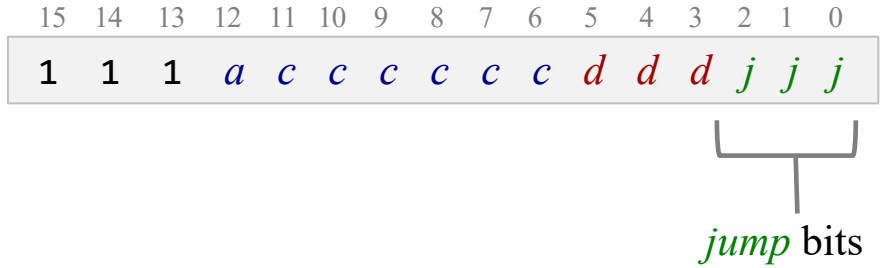
dest	*d*	*d*	*d*	effect: the value is stored in:
null	0	0	0	the value is not stored
M	0	0	1	RAM[A]
D	0	1	0	D register
DM	0	1	1	D register and RAM[A]
A	1	0	0	A register
AM	1	0	1	A register and RAM[A]
AD	1	1	0	A register and D register
ADM	1	1	1	A register, D register, and RAM[A]

C-instruction

Symbolic syntax: *dest* = *comp* ; *jump*

comp is mandatory.
If *dest* is empty, the = is omitted; If *jump* is empty, the ; is omitted

Binary syntax:



jump	*j*	*j*	*j*	effect:
null	0	0	0	no jump
JGT	0	0	1	if *comp* > 0 jump
JEQ	0	1	0	if *comp* = 0 jump
JGE	0	1	1	if *comp* ≥ 0 jump
JLT	1	0	0	if *comp* < 0 jump
JNE	1	0	1	if *comp* ≠ 0 jump
JLE	1	1	0	if *comp* ≤ 0 jump
JMP	1	1	1	Unconditional jump

The Hack language specification

A instruction

Symbolic: `@`*xxx* (*xxx* is a decimal value ranging from 0 to 32767, or a symbol bound to such a decimal value)

Binary: `0` *vvvvvvvvvvvvvvv* (*vv ... v* = 15-bit value of *xxx*)

C instruction

Symbolic: *dest* `=` *comp* `;` *jump* (*comp* is mandatory. If *dest* is empty, the `=` is omitted; If *jump* is empty, the `;` is omitted)

Binary: `111`*accccccdddjjj*

Predefined symbols:

symbol	value
R0	0
R1	1
R2	2
...	...
R15	15
SP	0
LCL	1
ARG	2
THIS	3
THAT	4
SCREEN	16384
KBD	24576

comp		*c*	*c*	*c*	*c*	*c*	*c*
0		1	0	1	0	1	0
1		1	1	1	1	1	1
-1		1	1	1	0	1	0
D		0	0	1	1	0	0
A	M	1	1	0	0	0	0
!D		0	0	1	1	0	1
!A	!M	1	1	0	0	0	1

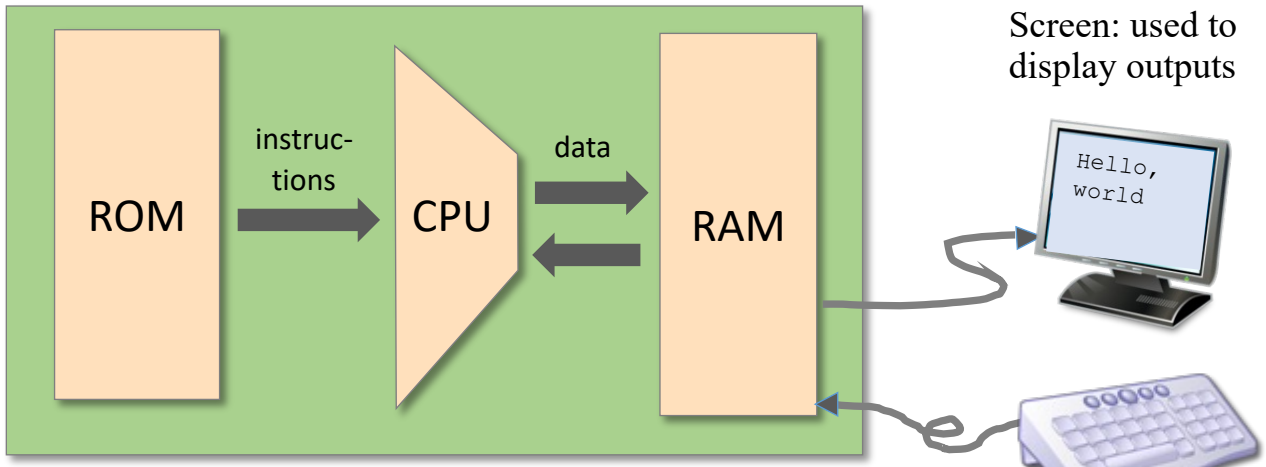
- Project 4

Input / output



Screen: used to display outputs

Keyboard: used to enter inputs

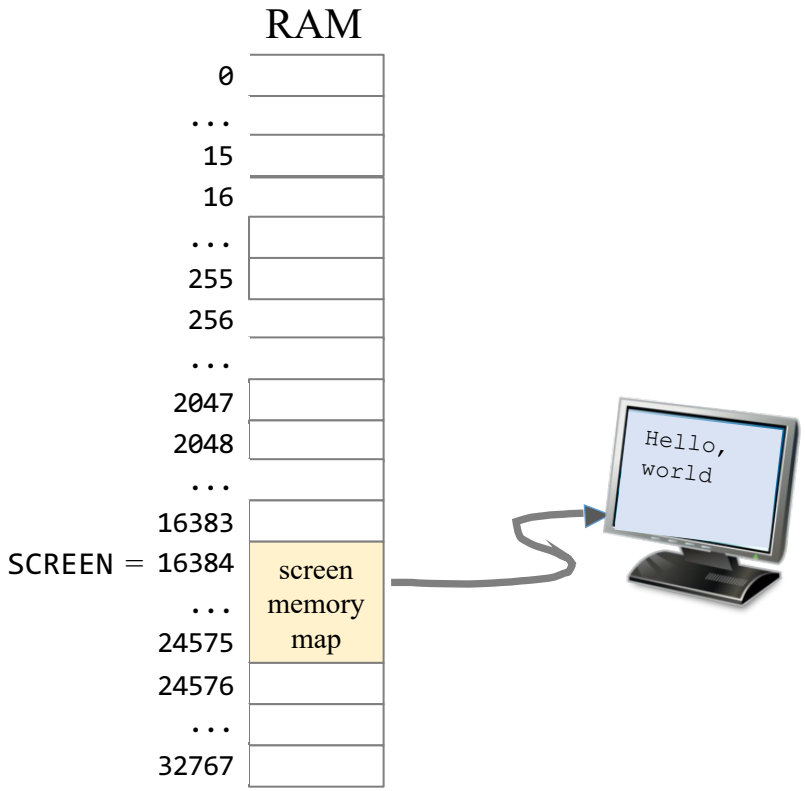
High-level I/O handling (later in the course):

I/O libraries for handling text, graphics, audio, video, …

Low-level I/O handling:

Manipulating bits in memory resident *bitmaps*.

Bitmaps



Screen memory map:

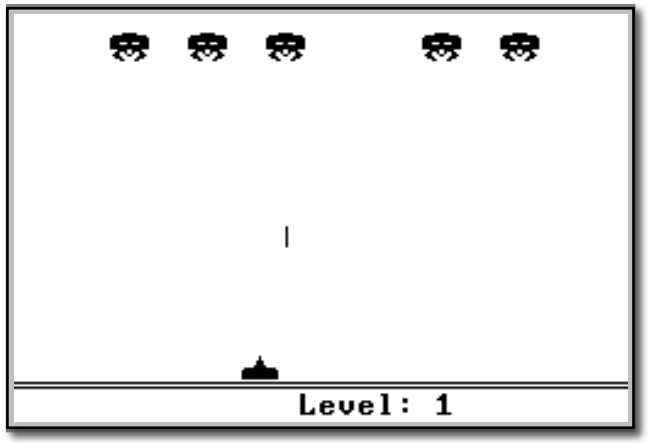
An 8K memory block, dedicated to representing a black-and-white display unit

Base address: SCREEN = 16384 (predefined symbol)

Output is rendered by writing bits in the screen memory map.

Bitmaps

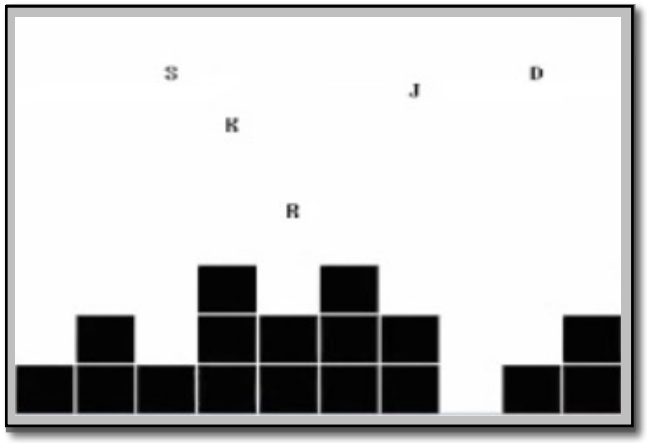
Physical screen



Screen shots of computer games developed on the Hack computer

Bitmaps

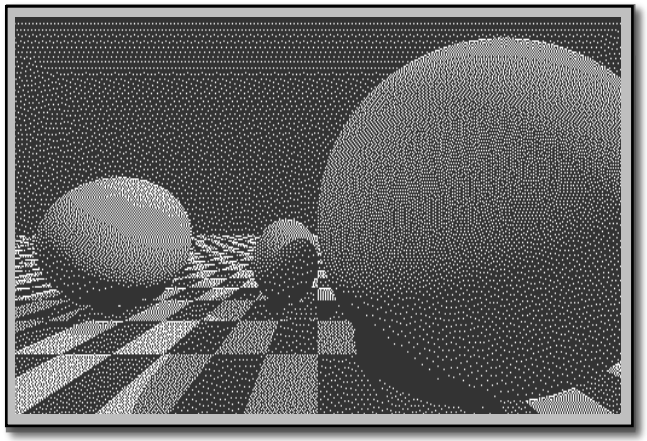
Physical screen



Screen shots of computer games developed on the Hack computer

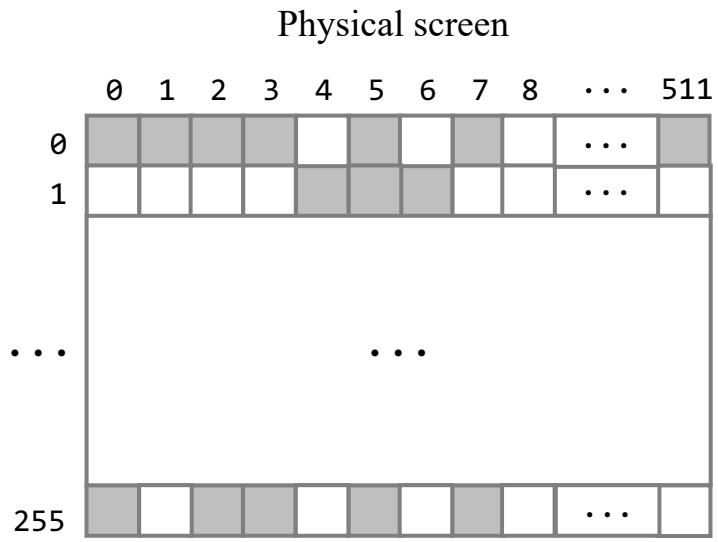
Bitmaps

Physical screen

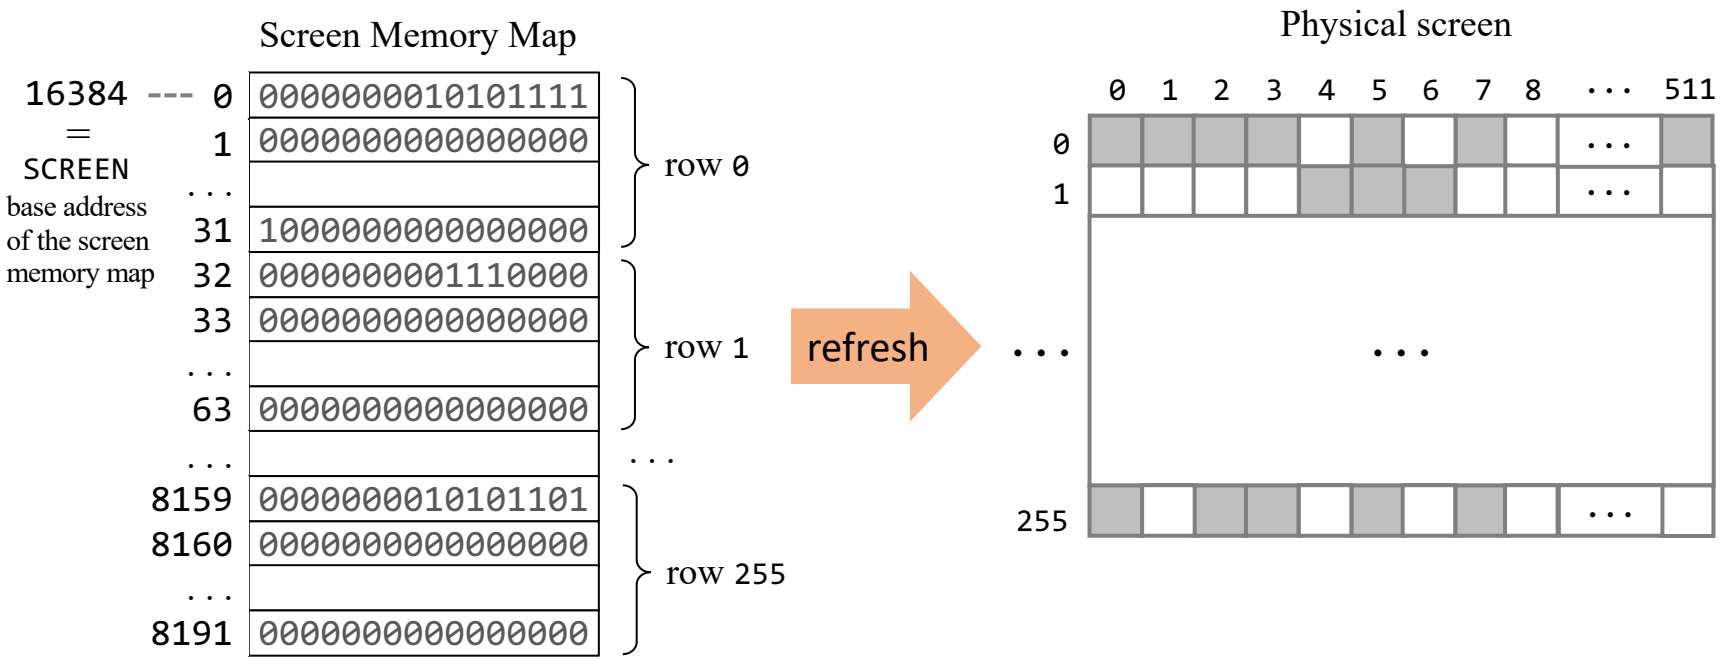


Screen shots of computer games developed on the Hack computer

Bitmaps



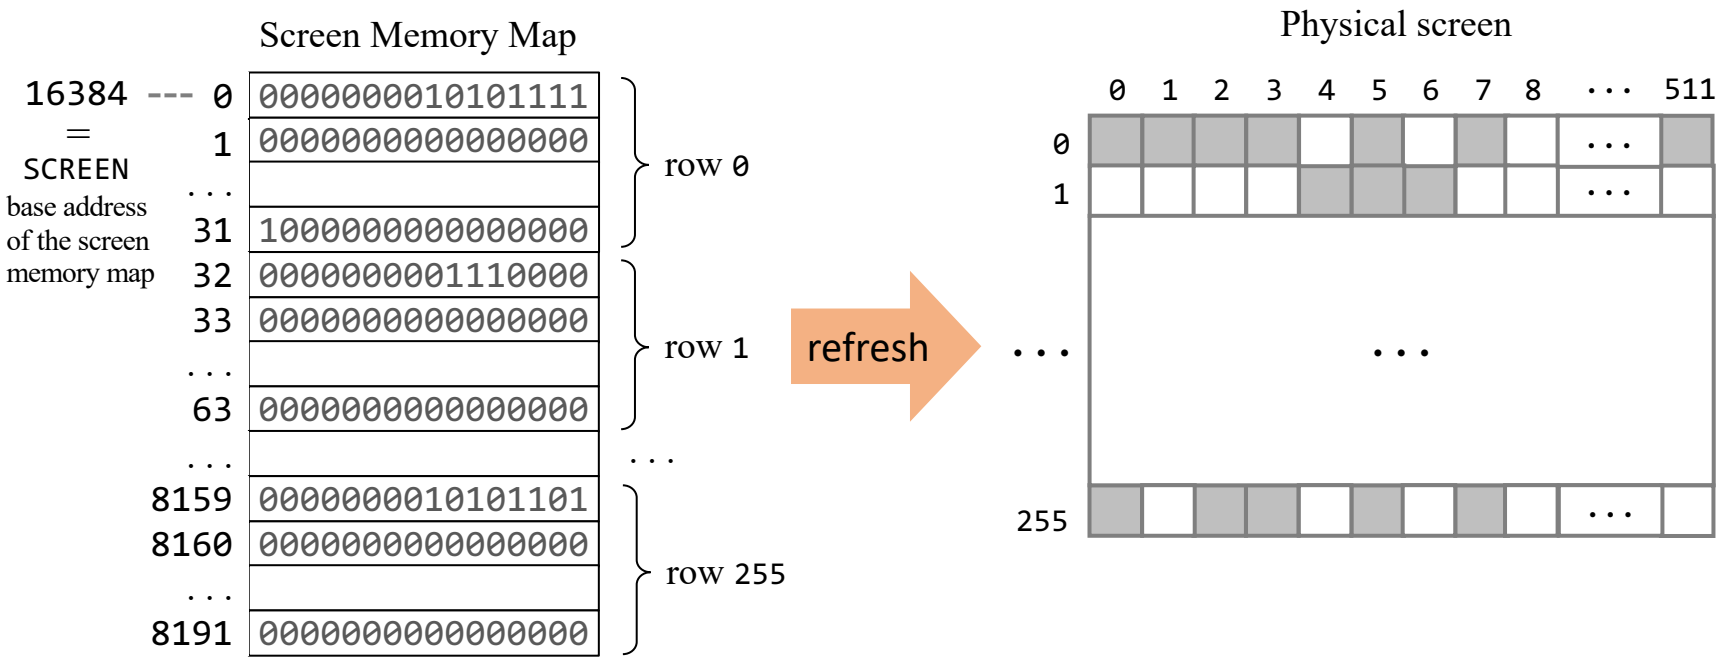
Bitmaps



Mapping

The (*row*, *col*) pixel in the physical screen is represented by the $(col \% 16)th$ bit in RAM address $\text{SCREEN} + 32 * row + col/16$

Bitmaps



To set the (*row* , *col*) pixel to black or white:

addr ← SCREEN + 32 * *row* + *col* / 16

word ← RAM[*addr*]

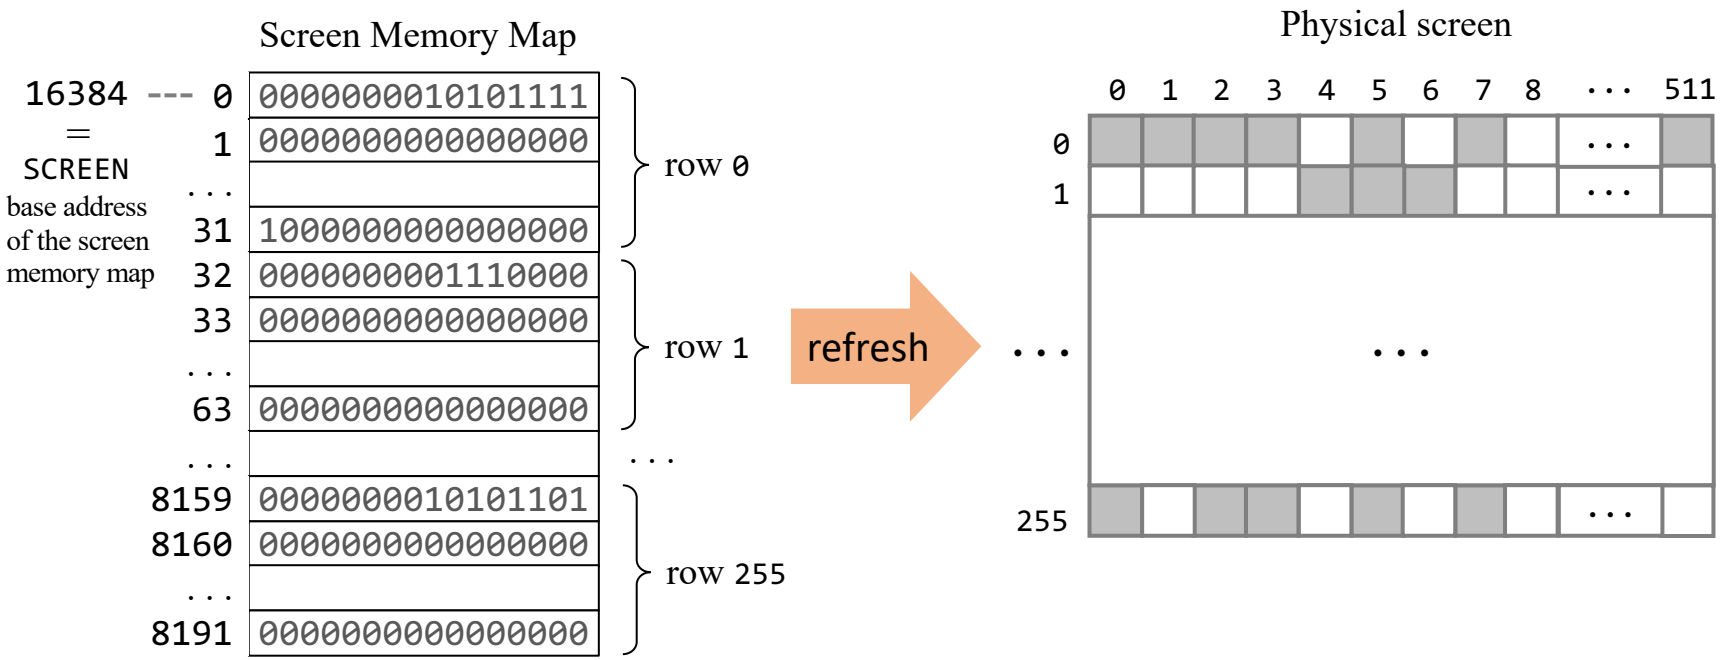
Set the (*col* % 16)*th* bit of *word* to 0 or 1

RAM[*addr*] ← *word*

Not to worry...

Cool Bitmap Editor coming up

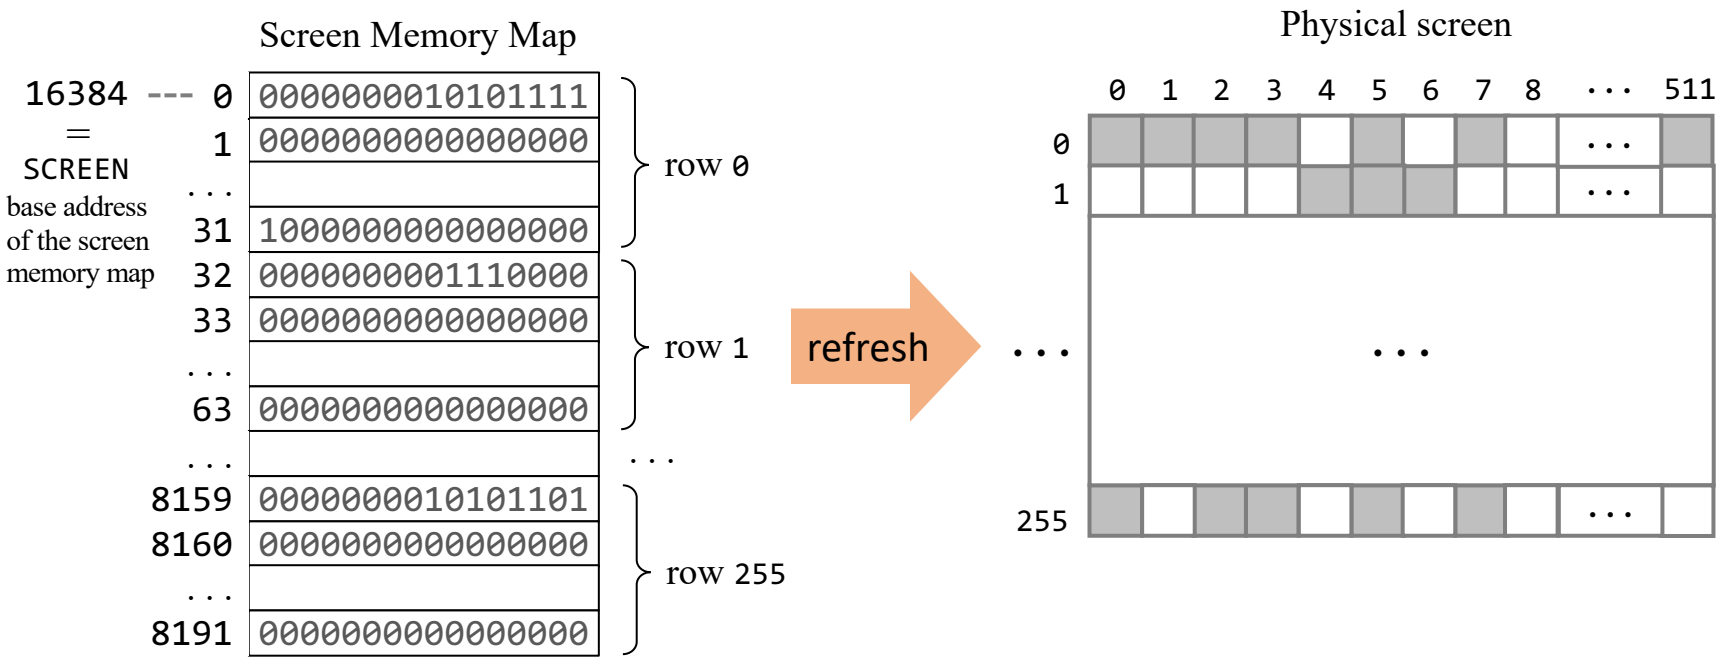
Bitmaps



Examples of simple patterns that can be drawn relatively easily:

```
// Sets the first (left) 16 pixels
// of the top row to black
```

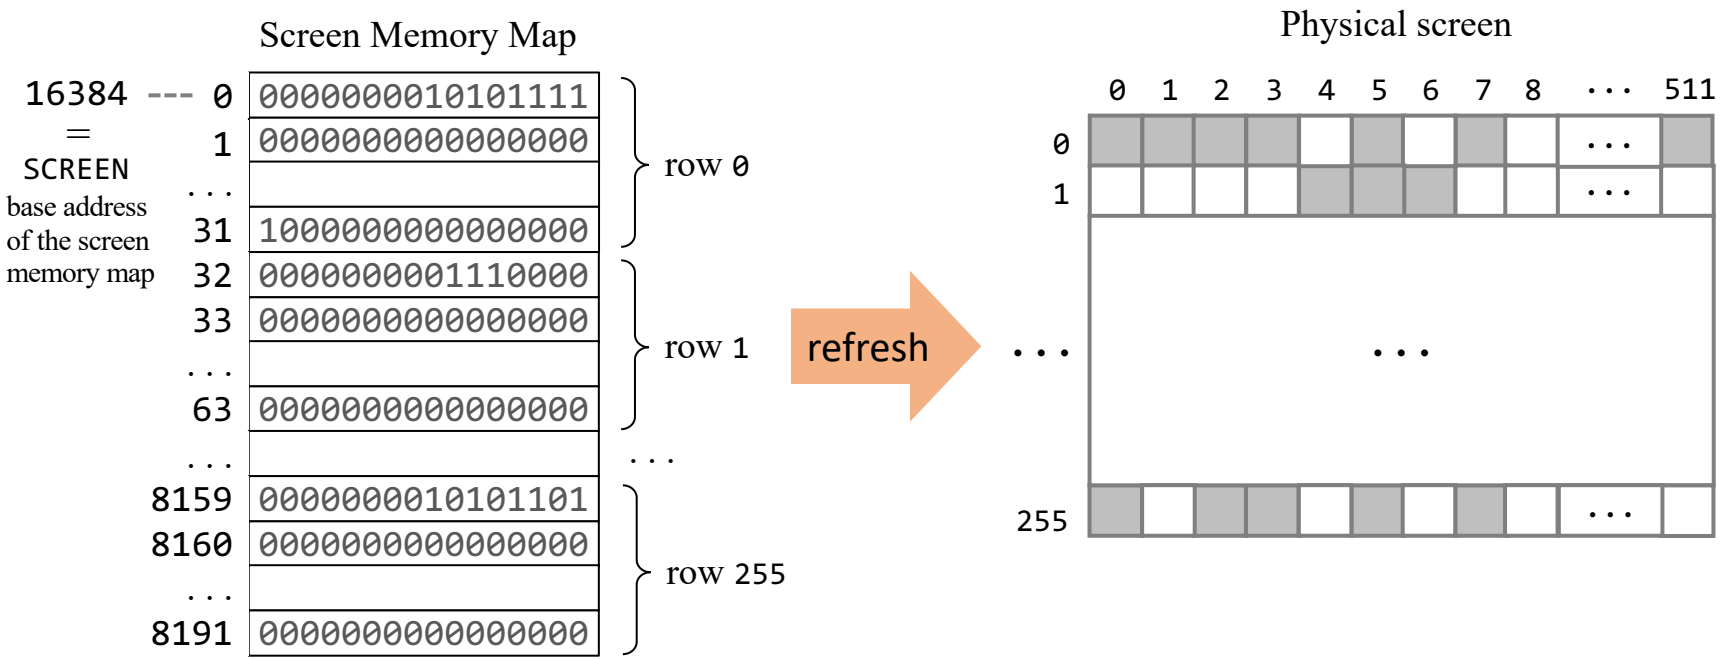
Bitmaps



Examples of simple patterns that can be drawn relatively easily:

```
// Sets the first (left) 16 pixels
// of the top row to black
@SCREEN
M=-1        // -1 = 1111111111111111
```

Bitmaps

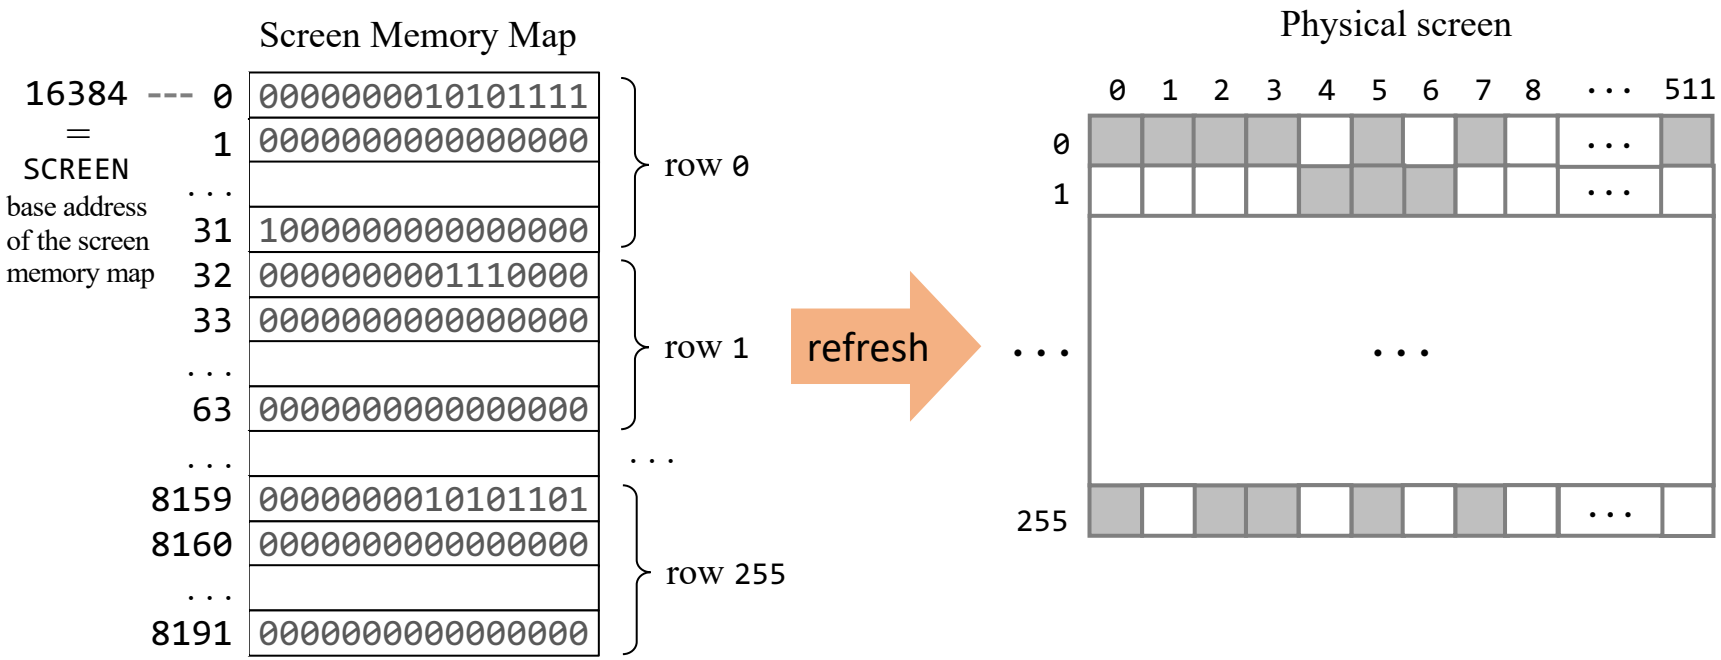


Examples of simple patterns that can be drawn relatively easily:

```
// Sets the first (left) 16 pixels
// of the top row to black
@SCREEN
M=-1        // -1 = 1111111111111111
```

```
// Sets the first 16 pixels
// of row 2 to black
?
```

Bitmaps

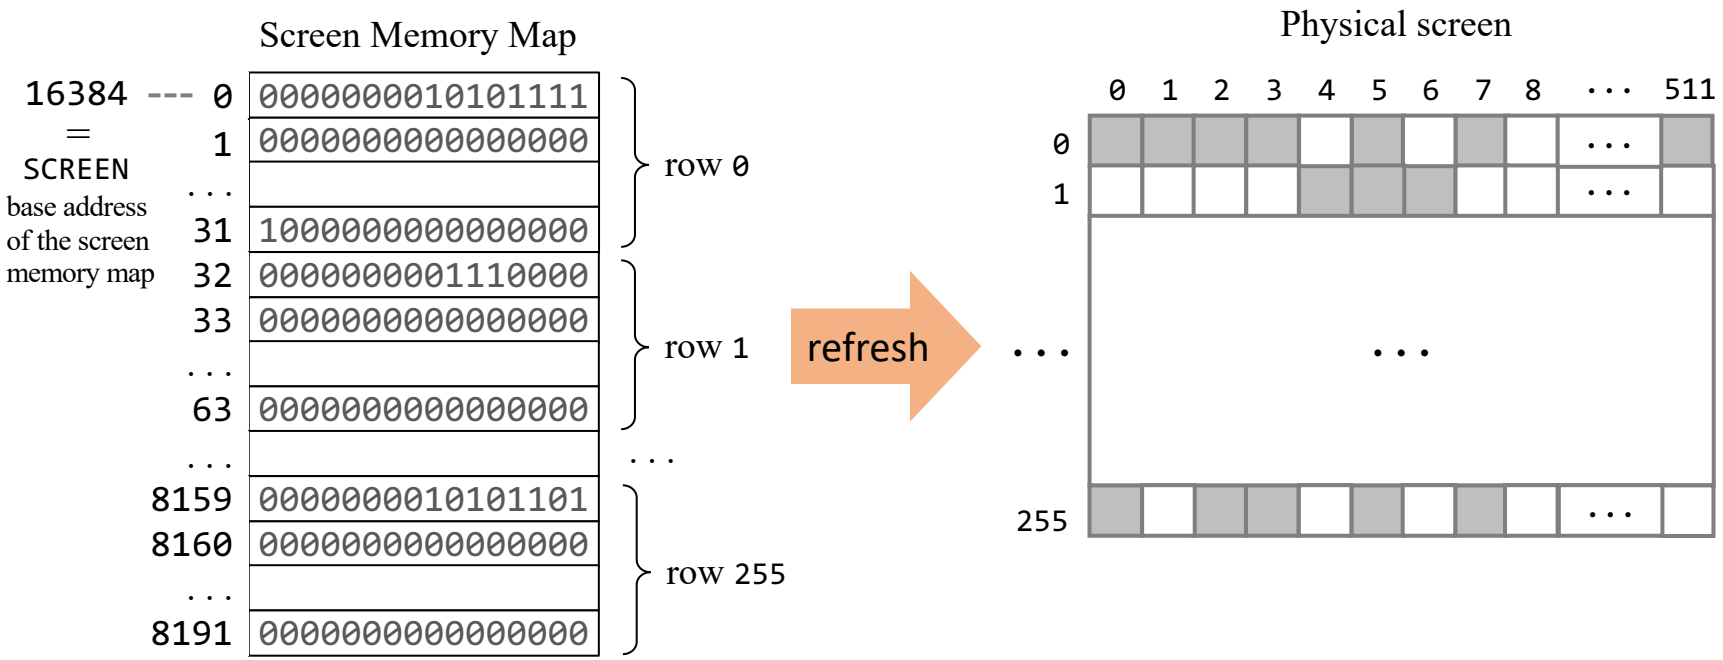


Examples of simple patterns that can be drawn relatively easily:

```
// Sets the first (left) 16 pixels
// of the top row to black
@SCREEN
M=-1        // -1 = 1111111111111111
```

```
// Sets the first 16 pixels
// of row 2 to black
@64
D=A
@SCREEN
A=A+D
M=-1
```

Bitmaps



Examples of simple patterns that can be drawn relatively easily:

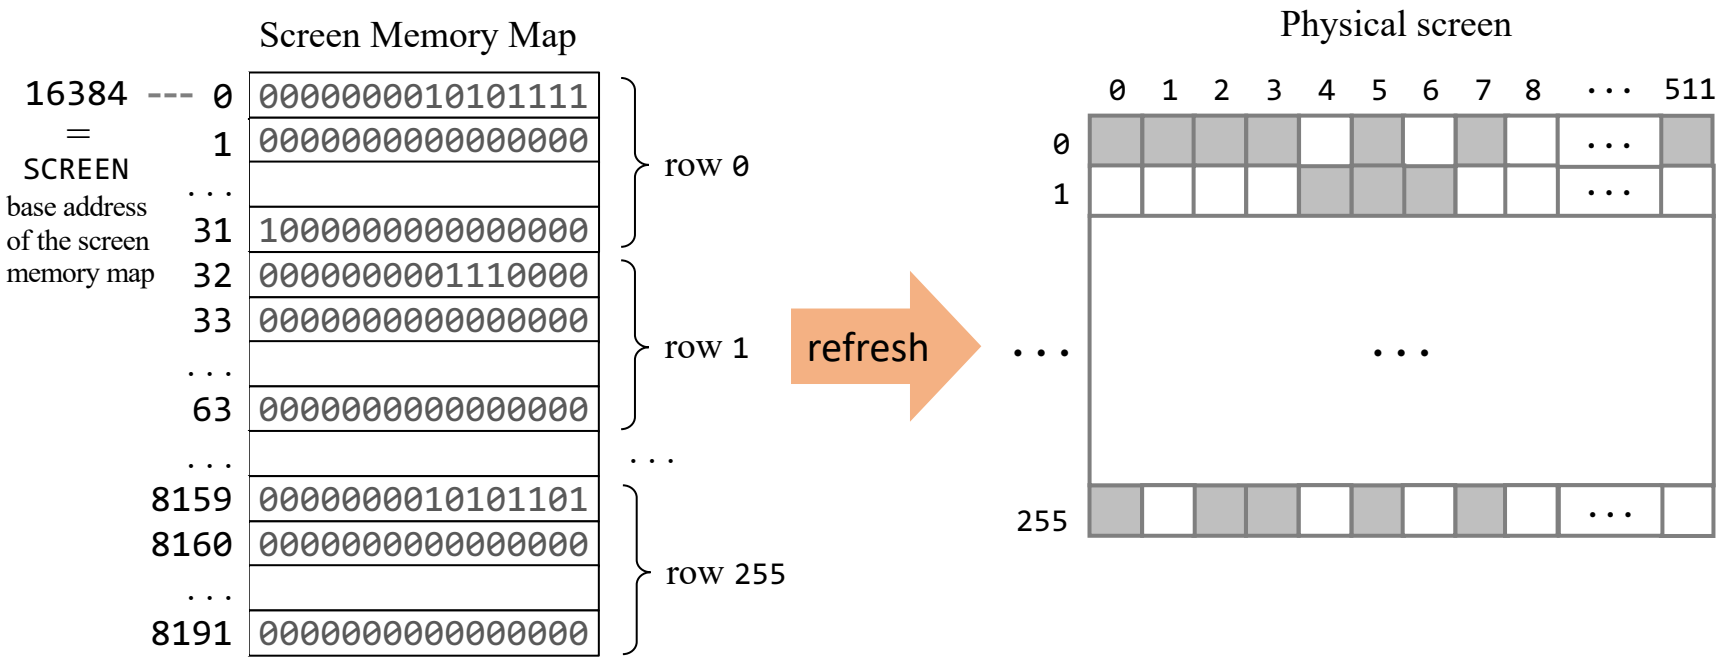
```
// Sets the first (left) 16 pixels
// of the top row to black
@SCREEN
M=-1        // -1 = 1111111111111111
```

```
// Sets the first 16 pixels
// of row 2 to black
@64
D=A
@SCREEN
A=A+D
M=-1
```

```
// Sets the entire screen
// to black / white
```

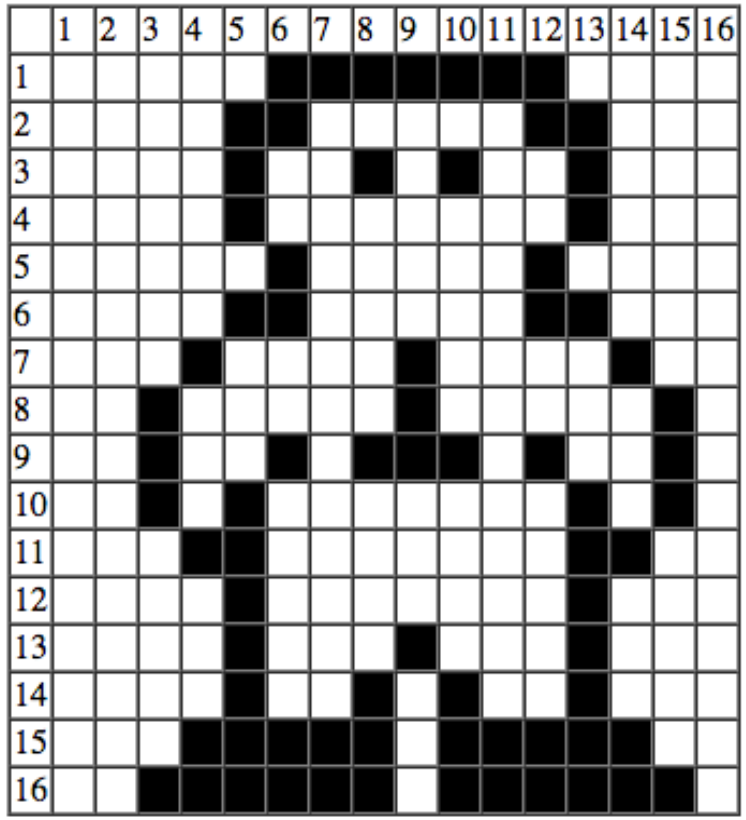
(Project 4)

Bitmaps



Simple graphics program:

Bitmap Editor



```
0000111111100000 = 4064
0001100000110000 = 6192
0001001010010000 = 4752
...
...
0111111011111100 = 32508
```

Bitmap editor

The user draws a pixeled image on a 2D grid

The tool generates code that draws the image in the RAM

The generated code can be copy-pasted into the code.

Located in this Git project

Note: The editor generates either Jack code or Hack assembly code – see the radio buttons at the very bottom of the editor's GUI.

The Hack Language

- ✓ Symbolic
- ✓ Binary
- ✓ Output
- ➡ Input
- Project 4

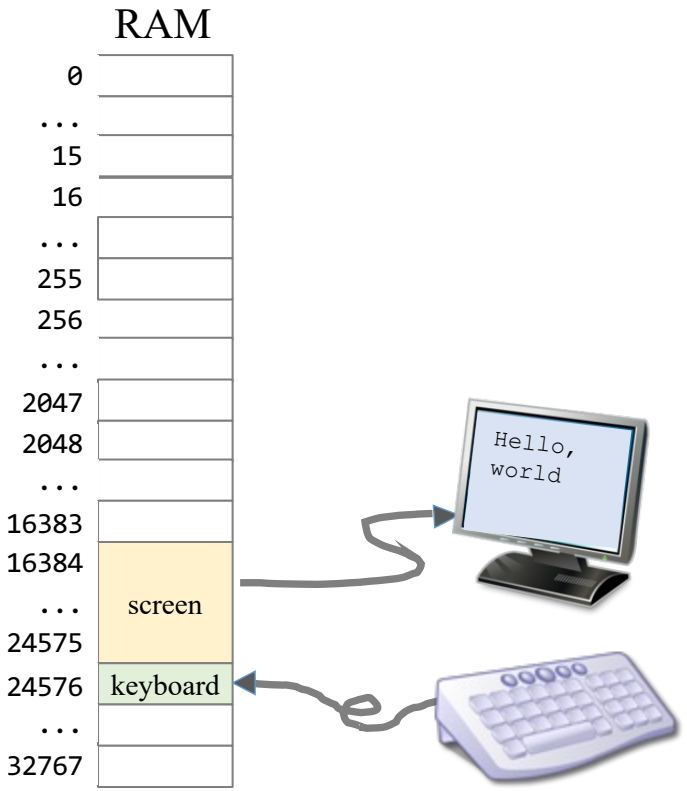
Input

High-level input handling (later in the course)

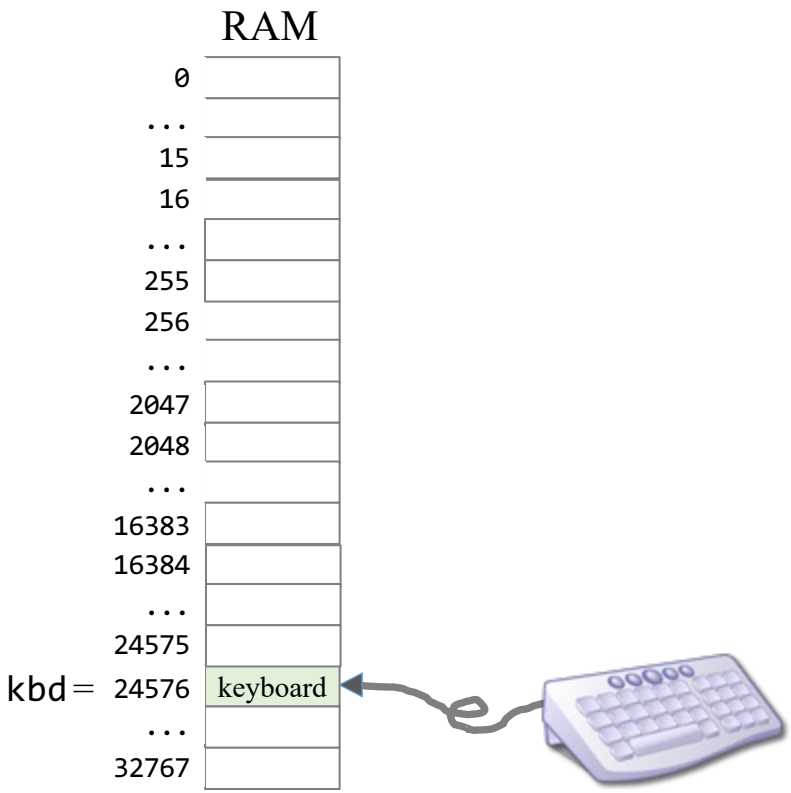
`readInt`, `readString`, ...

Low-level input handling

Read bits.



Input



Keyboard memory map

A single 16-bit memory location, dedicated to representing the keyboard.

Base address: `KBD` = 24576 (predefined symbol)

Reading inputs is affected by probing this register.

The Hack character set

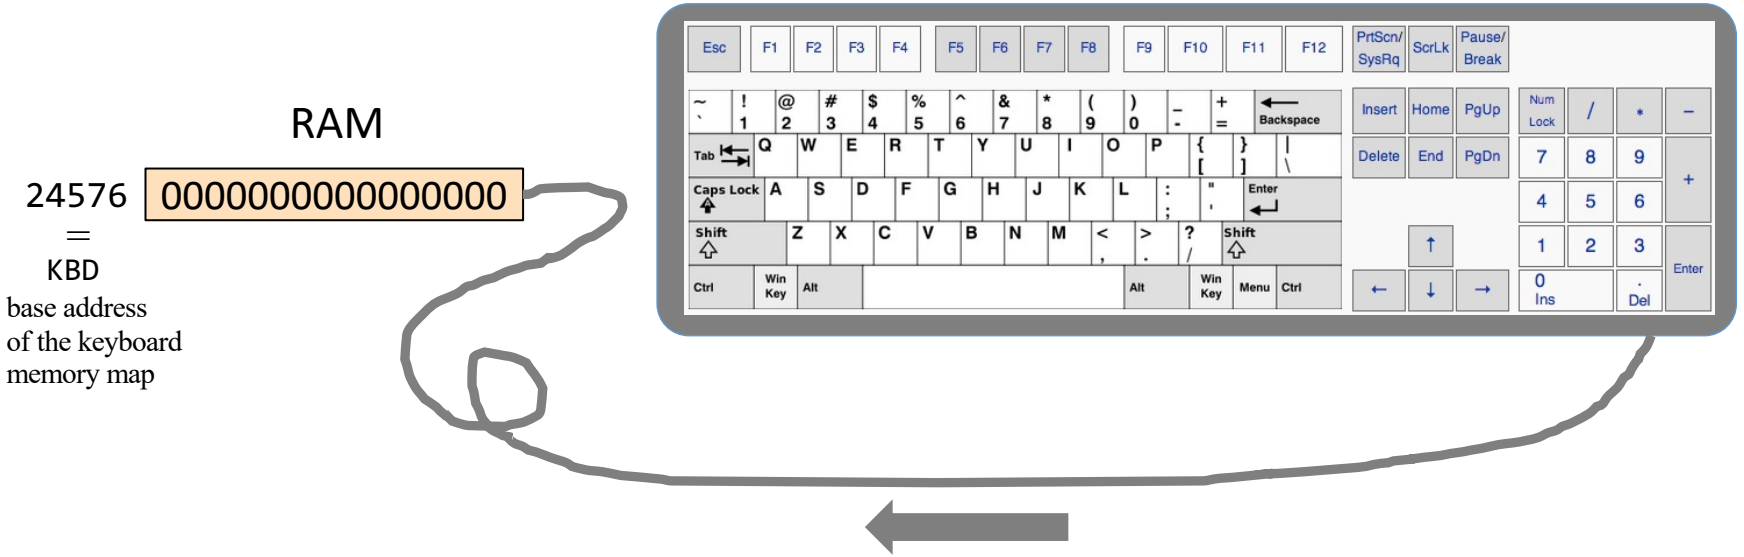
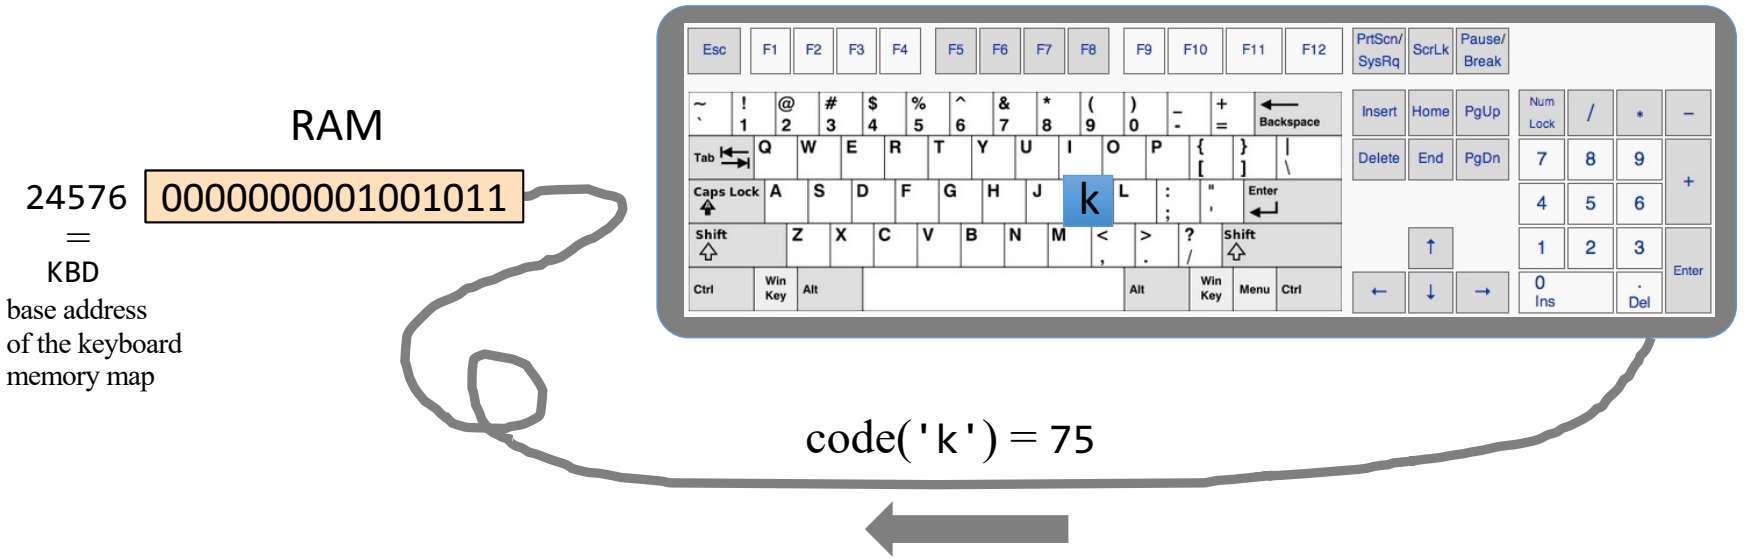
Memory mapped input

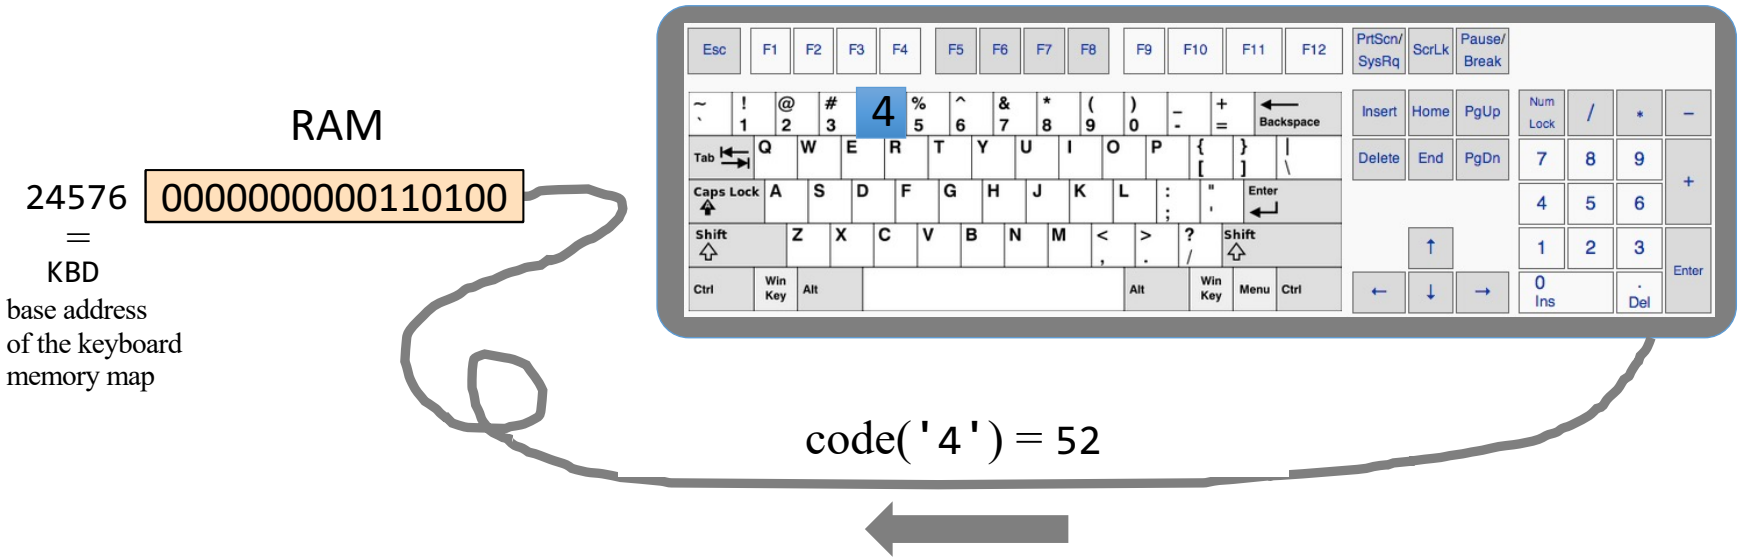


Memory mapped input



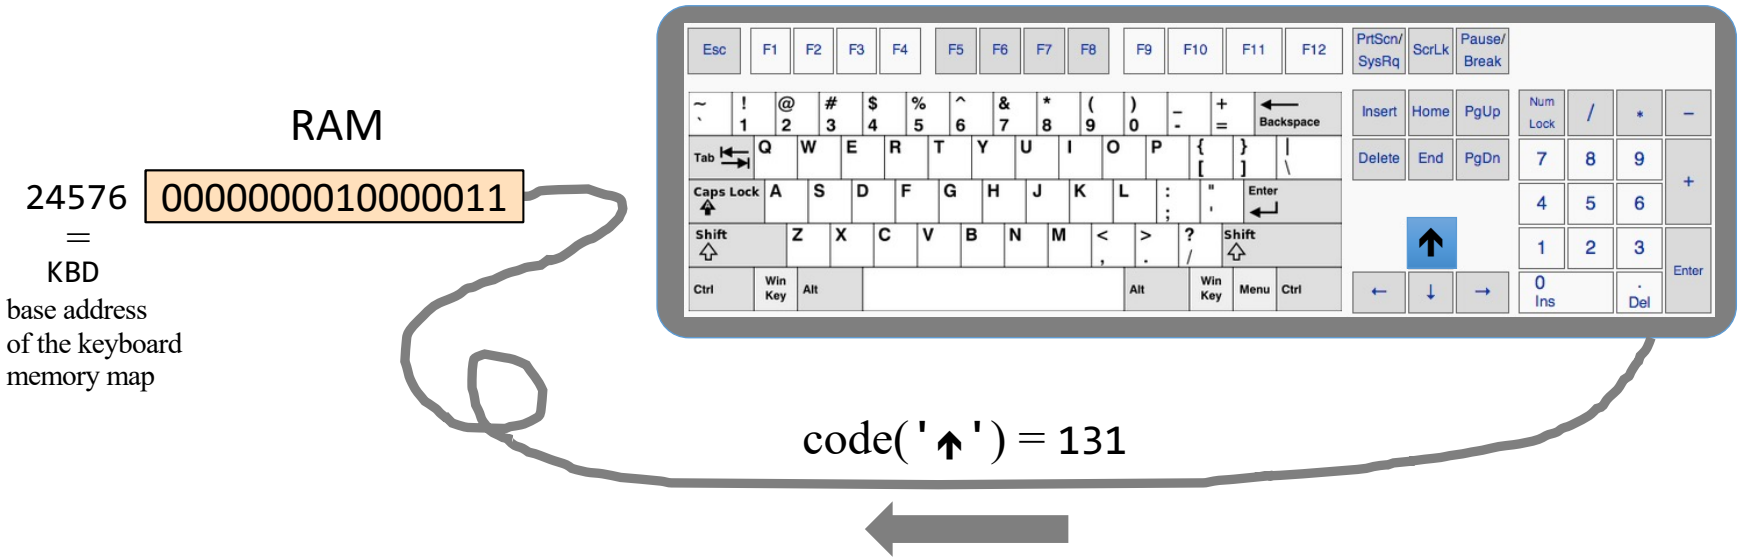
When a key is pressed on the keyboard,
the key's character code appears in the keyboard memory map.

Memory mapped input



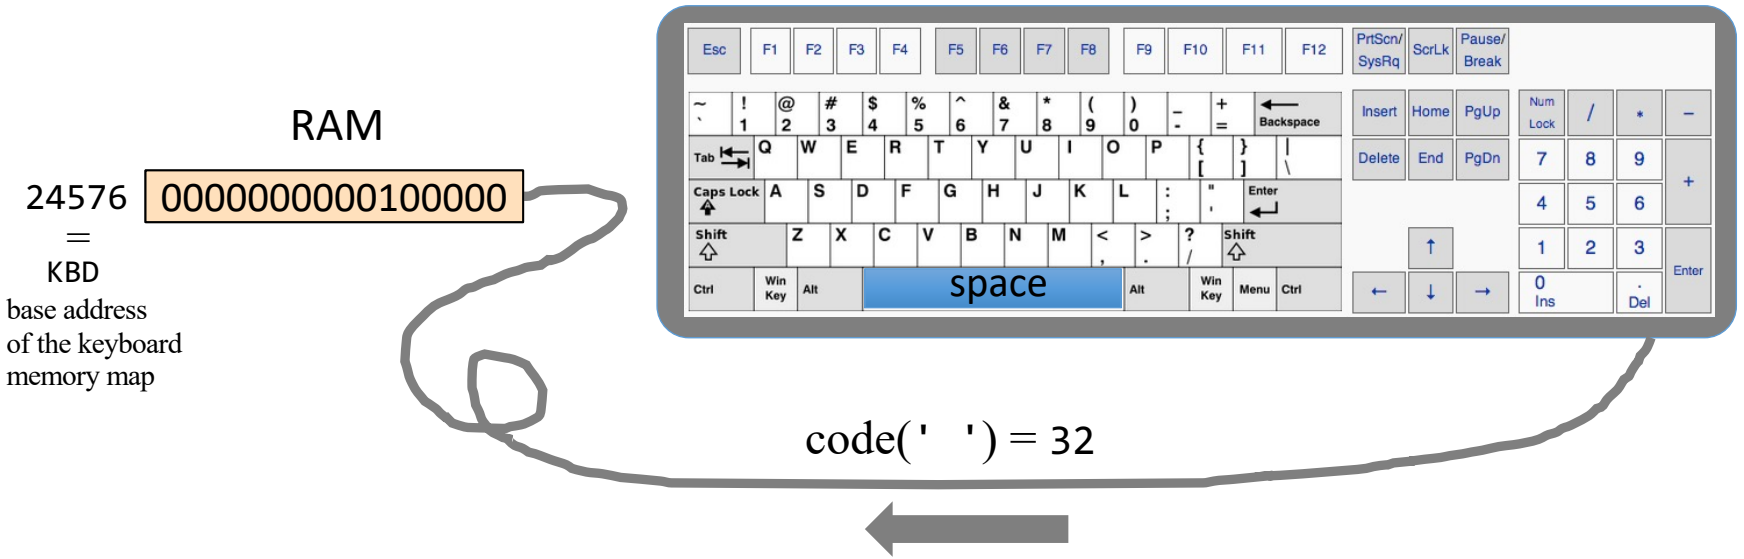
When a key is pressed on the keyboard,
the key's character code appears in the keyboard memory map.

Memory mapped input



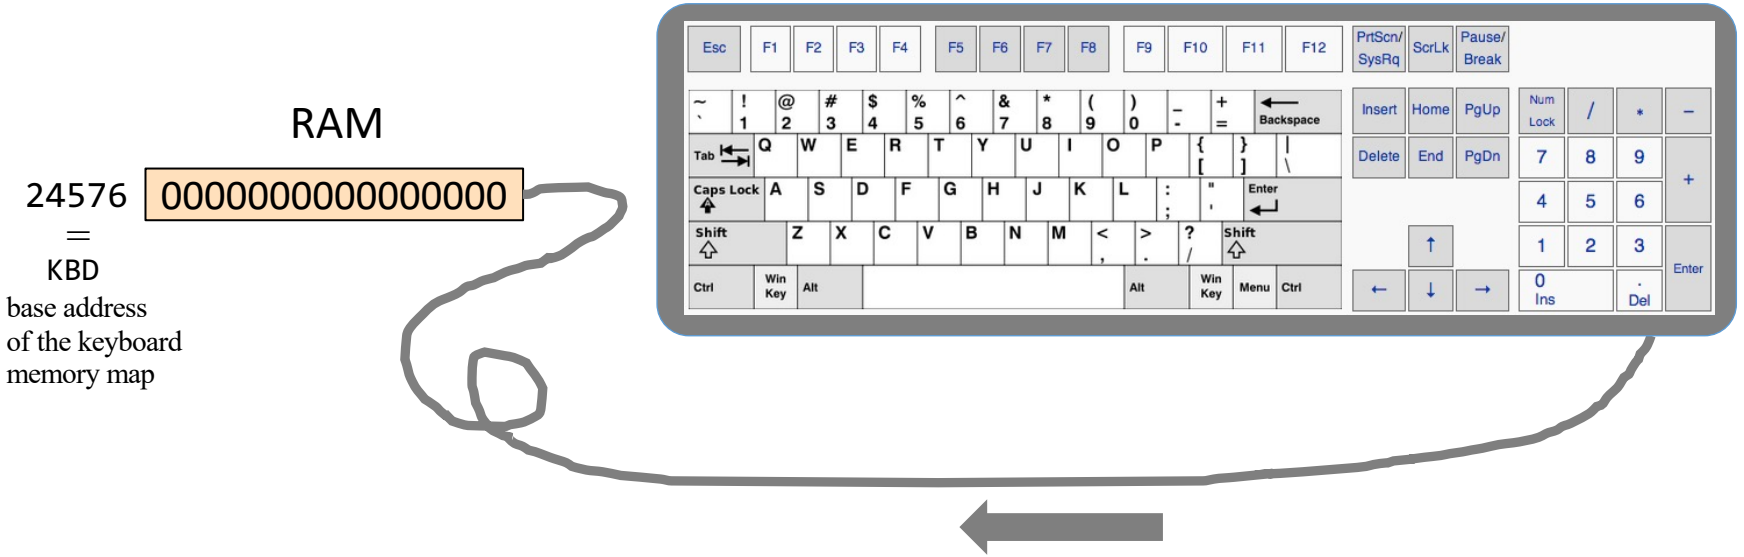
When a key is pressed on the keyboard,
the key's character code appears in the keyboard memory map.

Memory mapped input



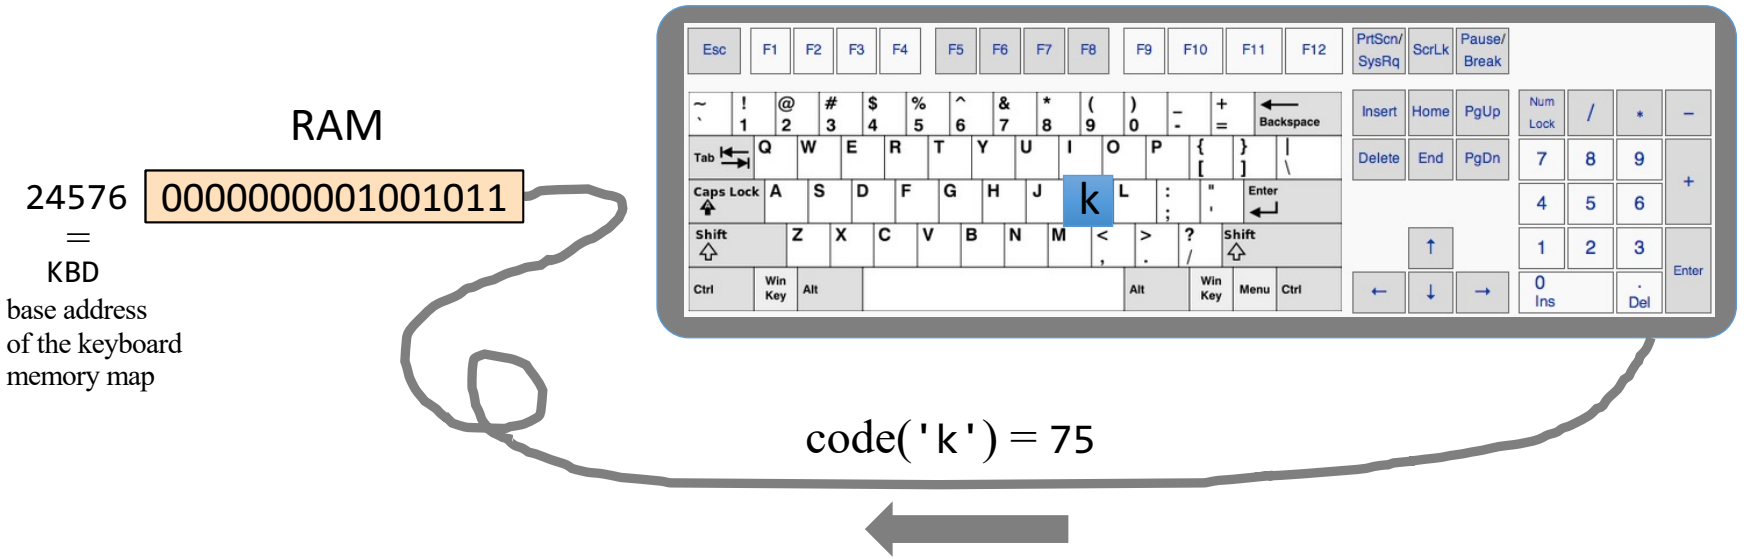
When a key is pressed on the keyboard,
the key's character code appears in the keyboard memory map.

Memory mapped input



When no key is pressed, the resulting code is `0`.

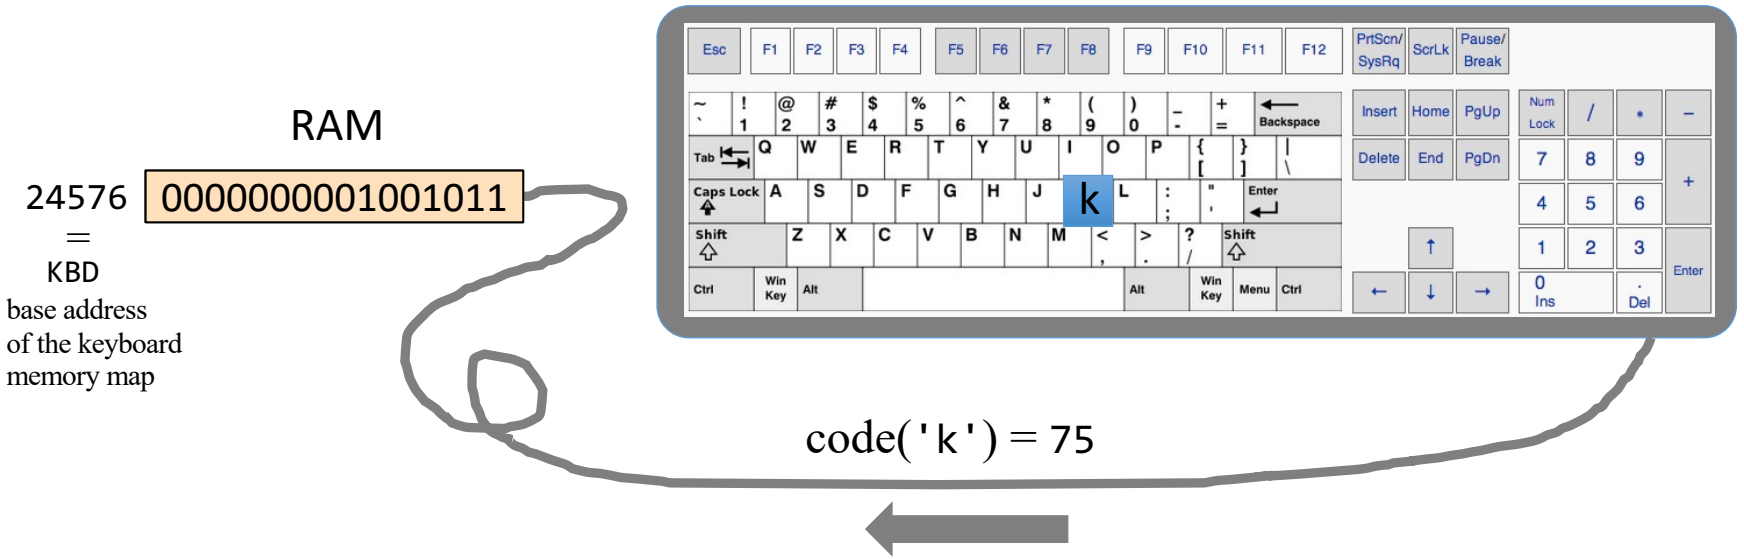
Reading inputs



Examples:

```
// Set D to the character code of
// the currently pressed key
```

Reading inputs

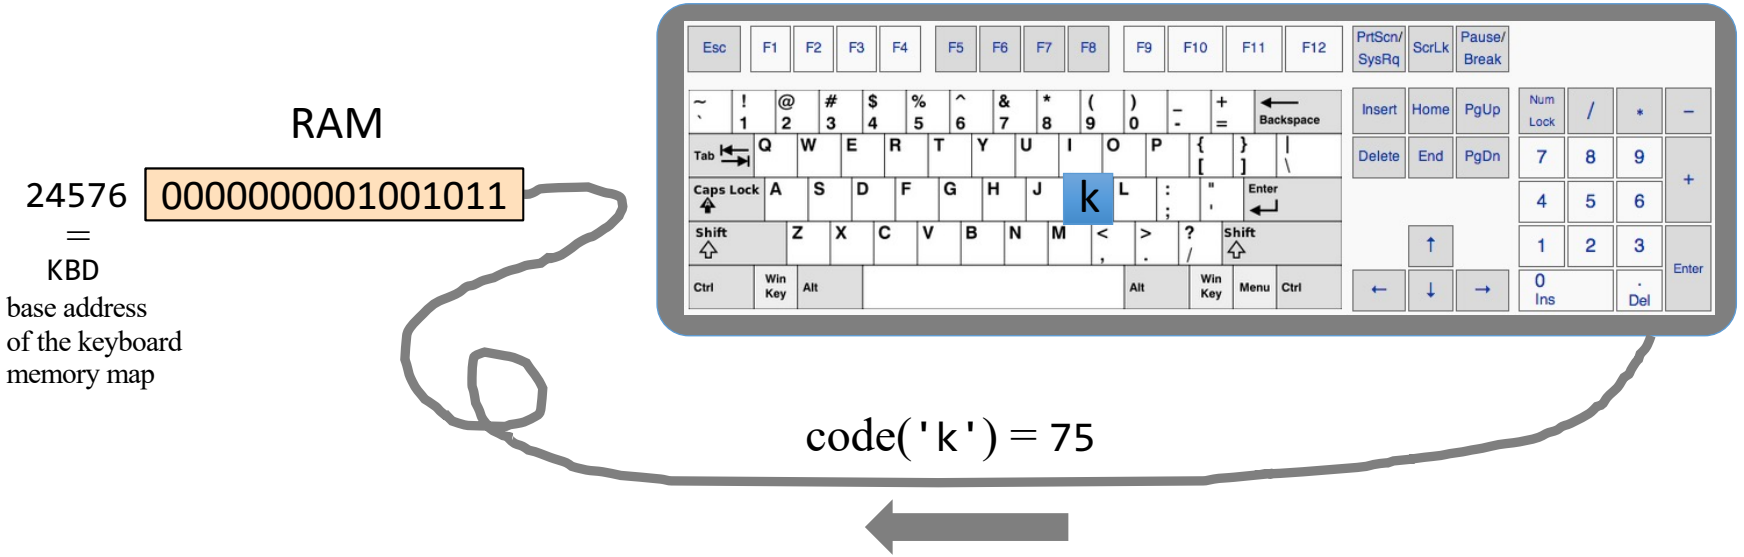


Examples:

```
// Set D to the character code of
// the currently pressed key
@KBD
D=M
```

```
// If the currently pressed key is 'q', goto END
```

Reading inputs



Examples:

```
// Set D to the character code of
// the currently pressed key
@KBD
D=M
```

```
// If the currently pressed key is 'q', goto END
@KBD
D=M
@113   // 'q'
D=D-A
@END
D;JEQ
```

Machine Language

- ✓ Output
- ✓ Input
- → Project 4

Project 4

Objectives

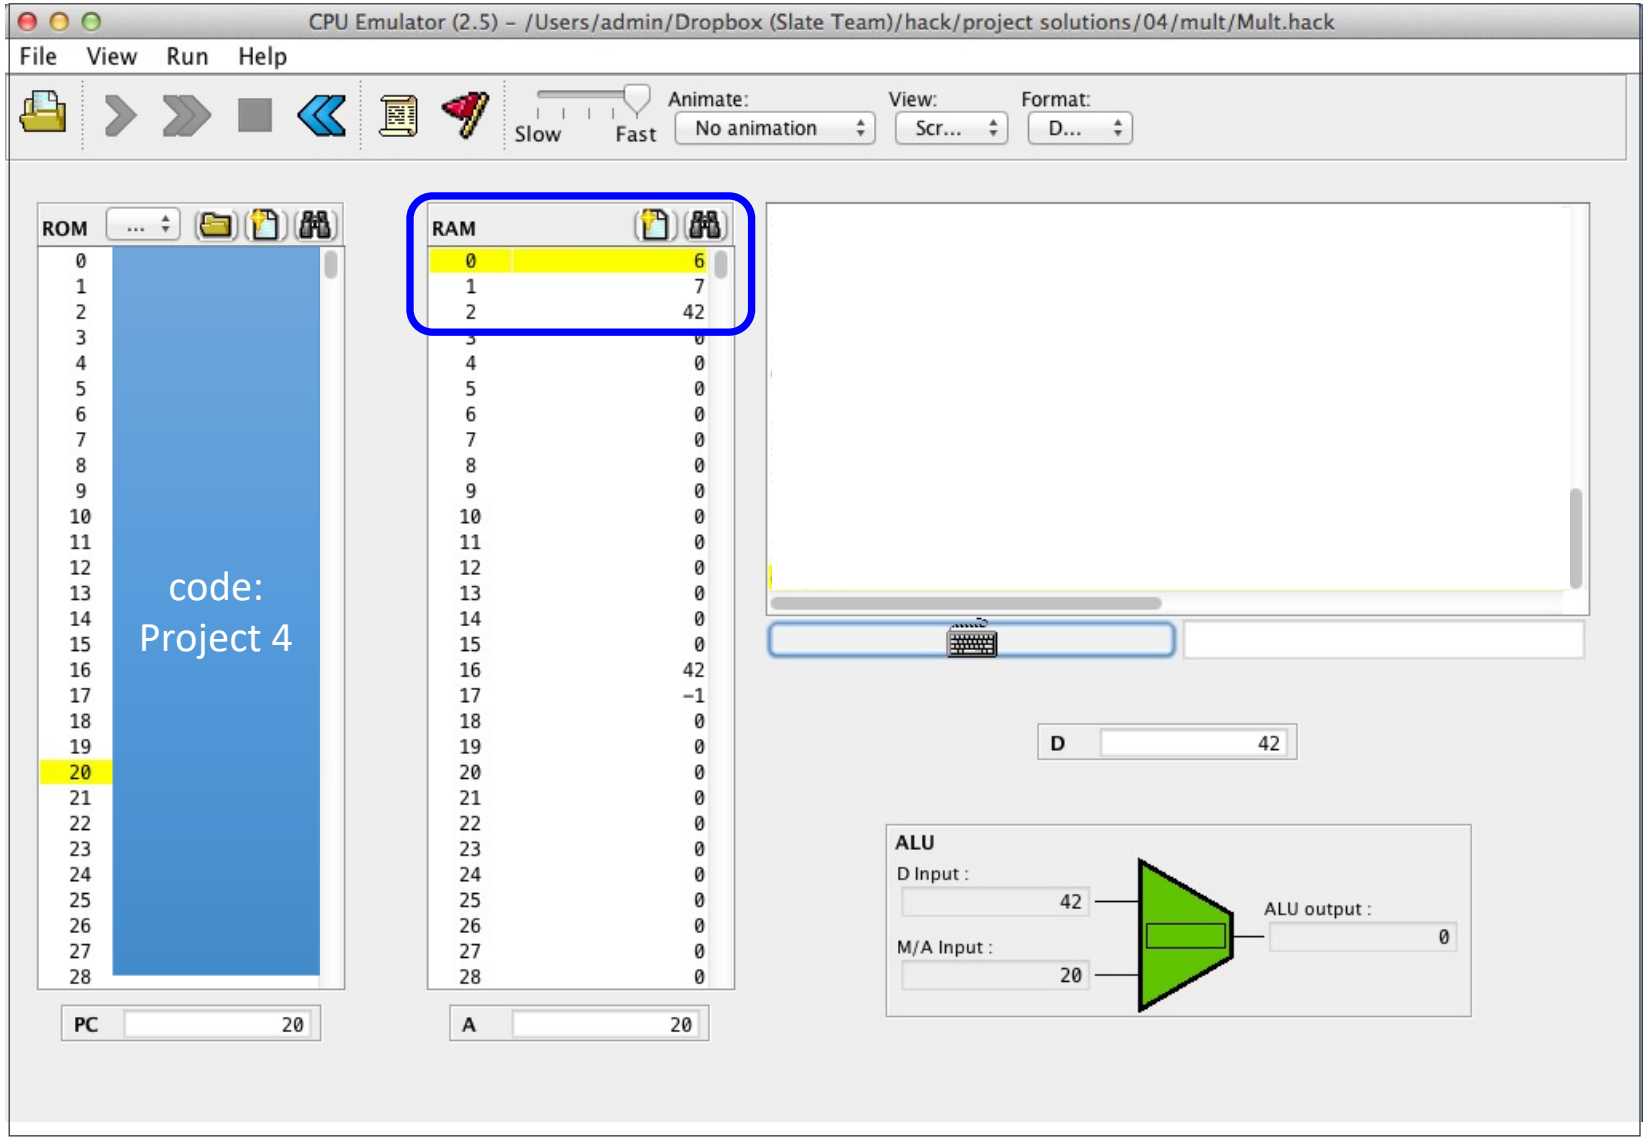
Gain a hands-on taste of:

- Low-level programming
- Assembly language
- The Hack computer

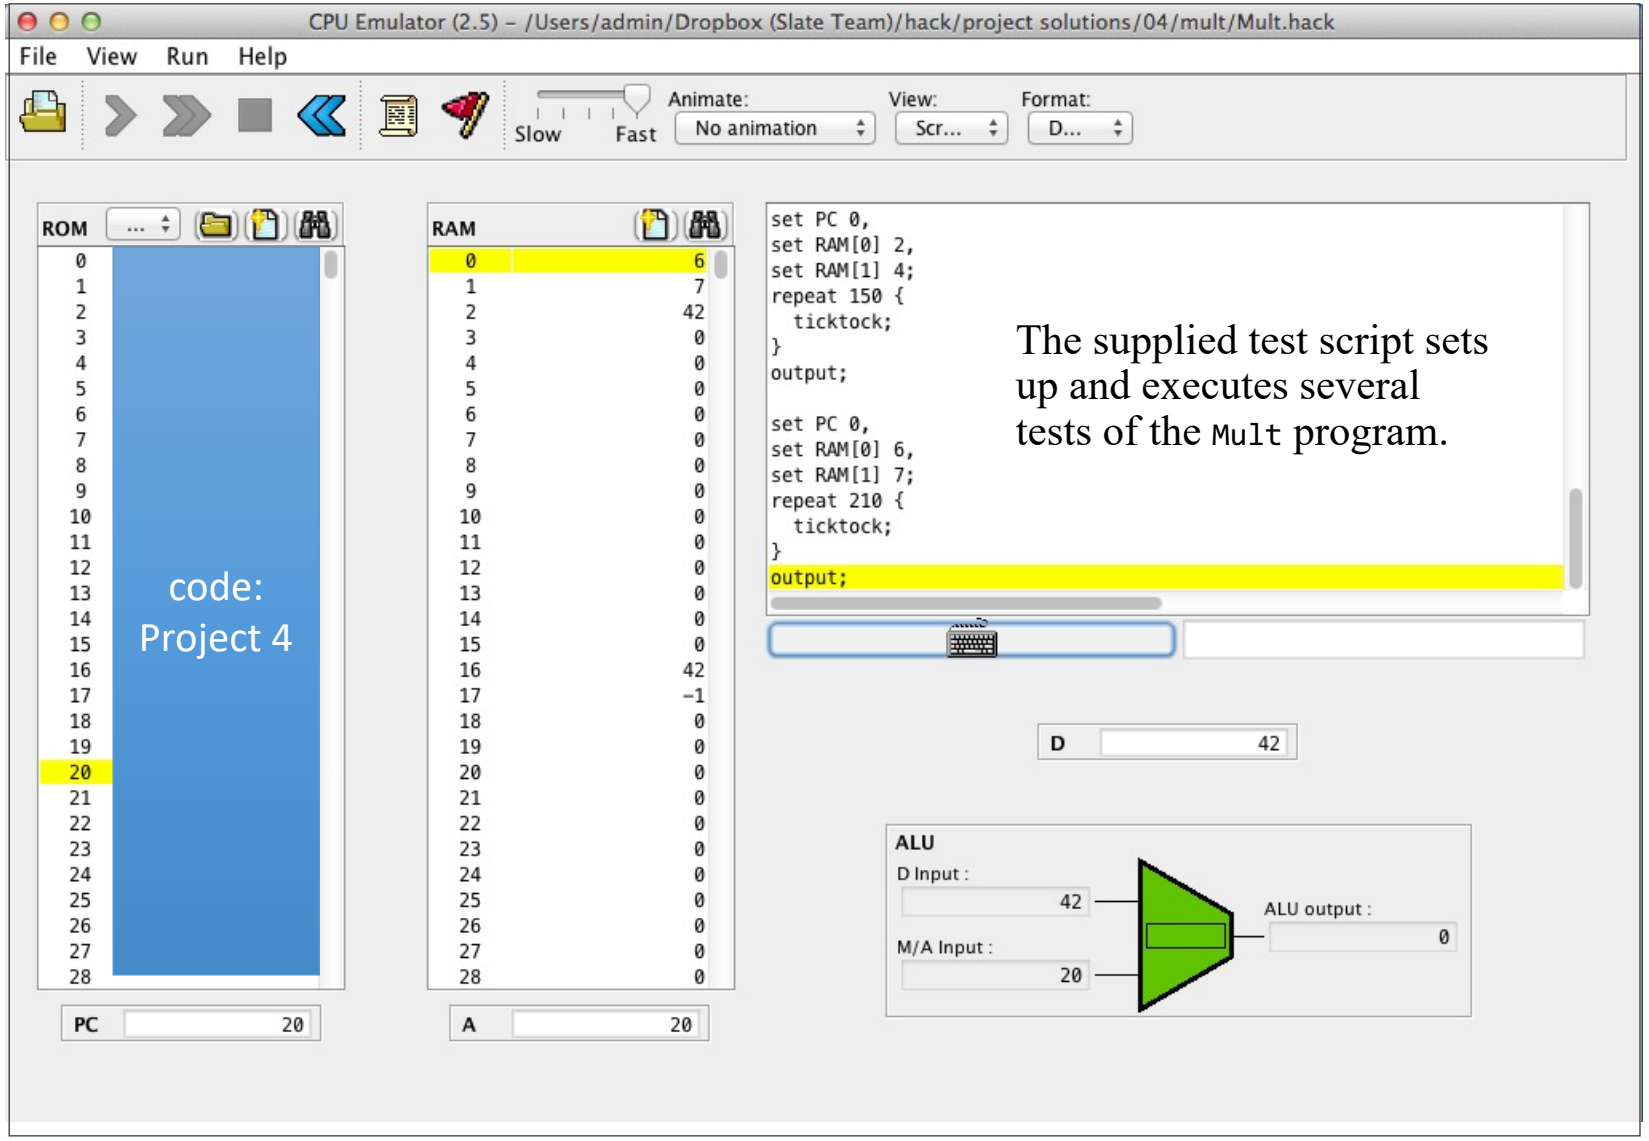
Tasks

- Write a simple algebraic program: `Mult`
- Write a simple interactive program: `Fill`
- Get creative: Define and write some program of your own (optional).

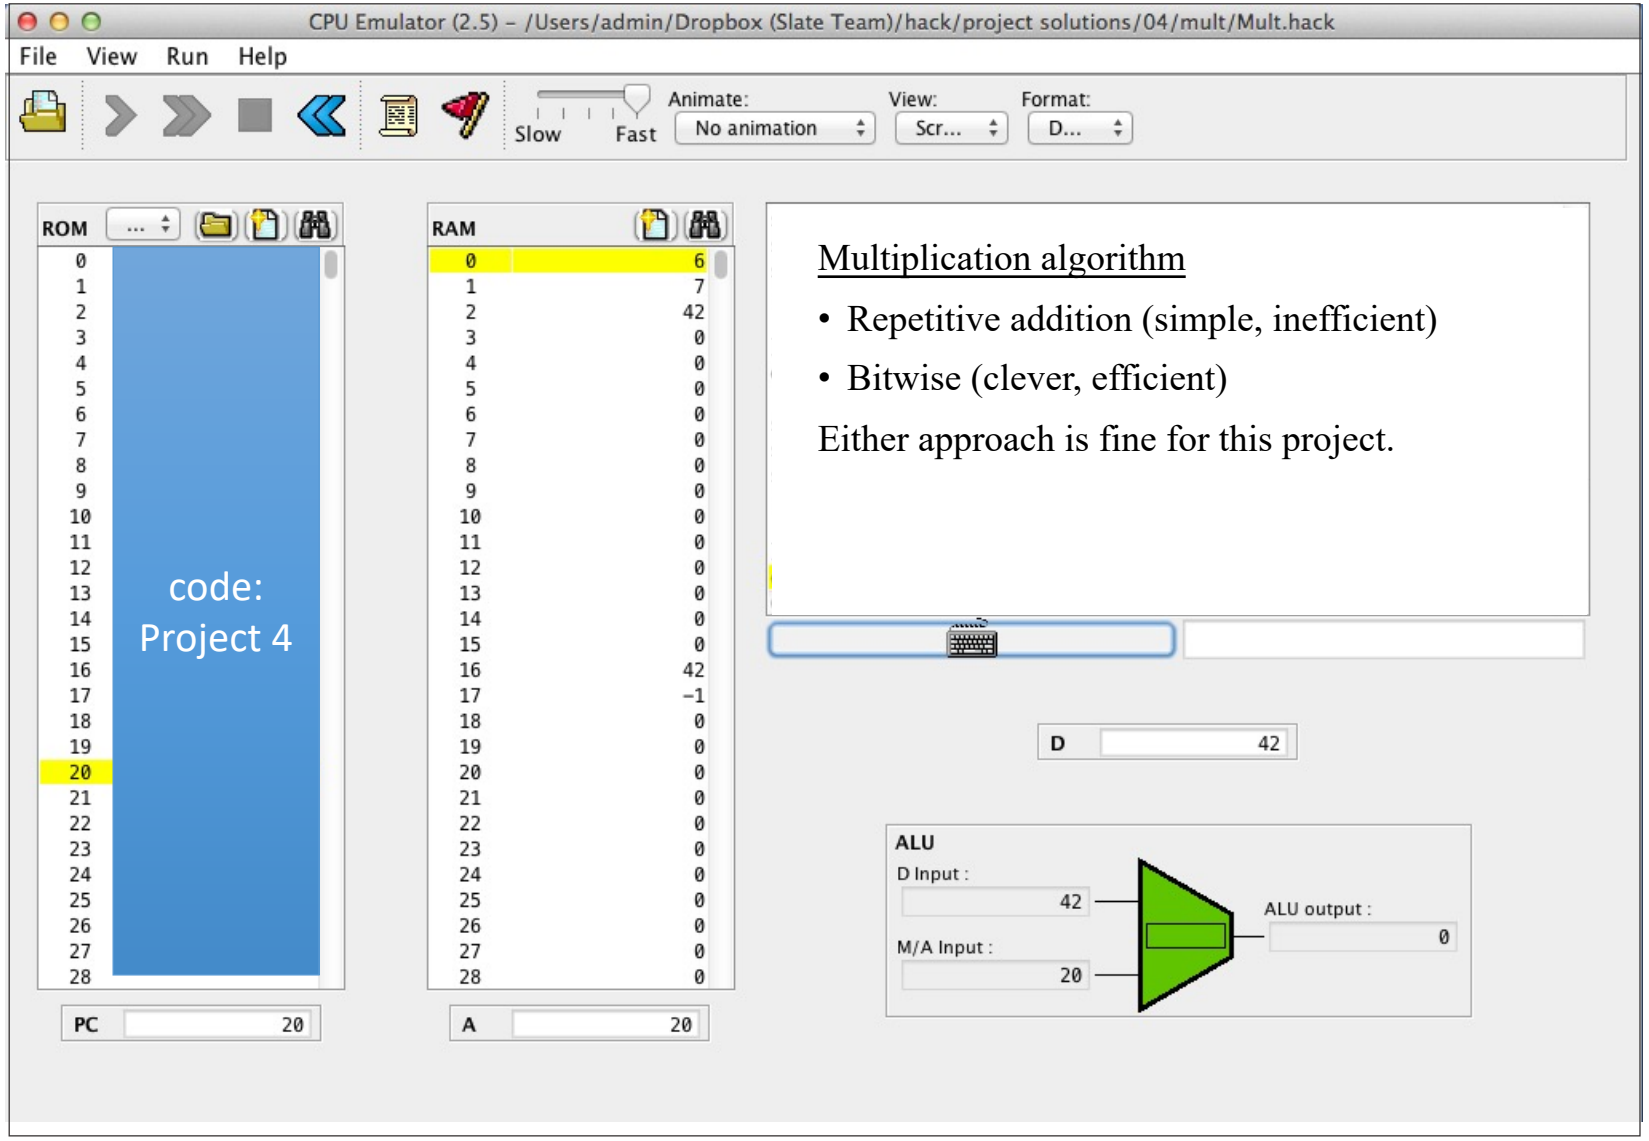
`Mult`: a program that computes `R2 = R0 * R1`



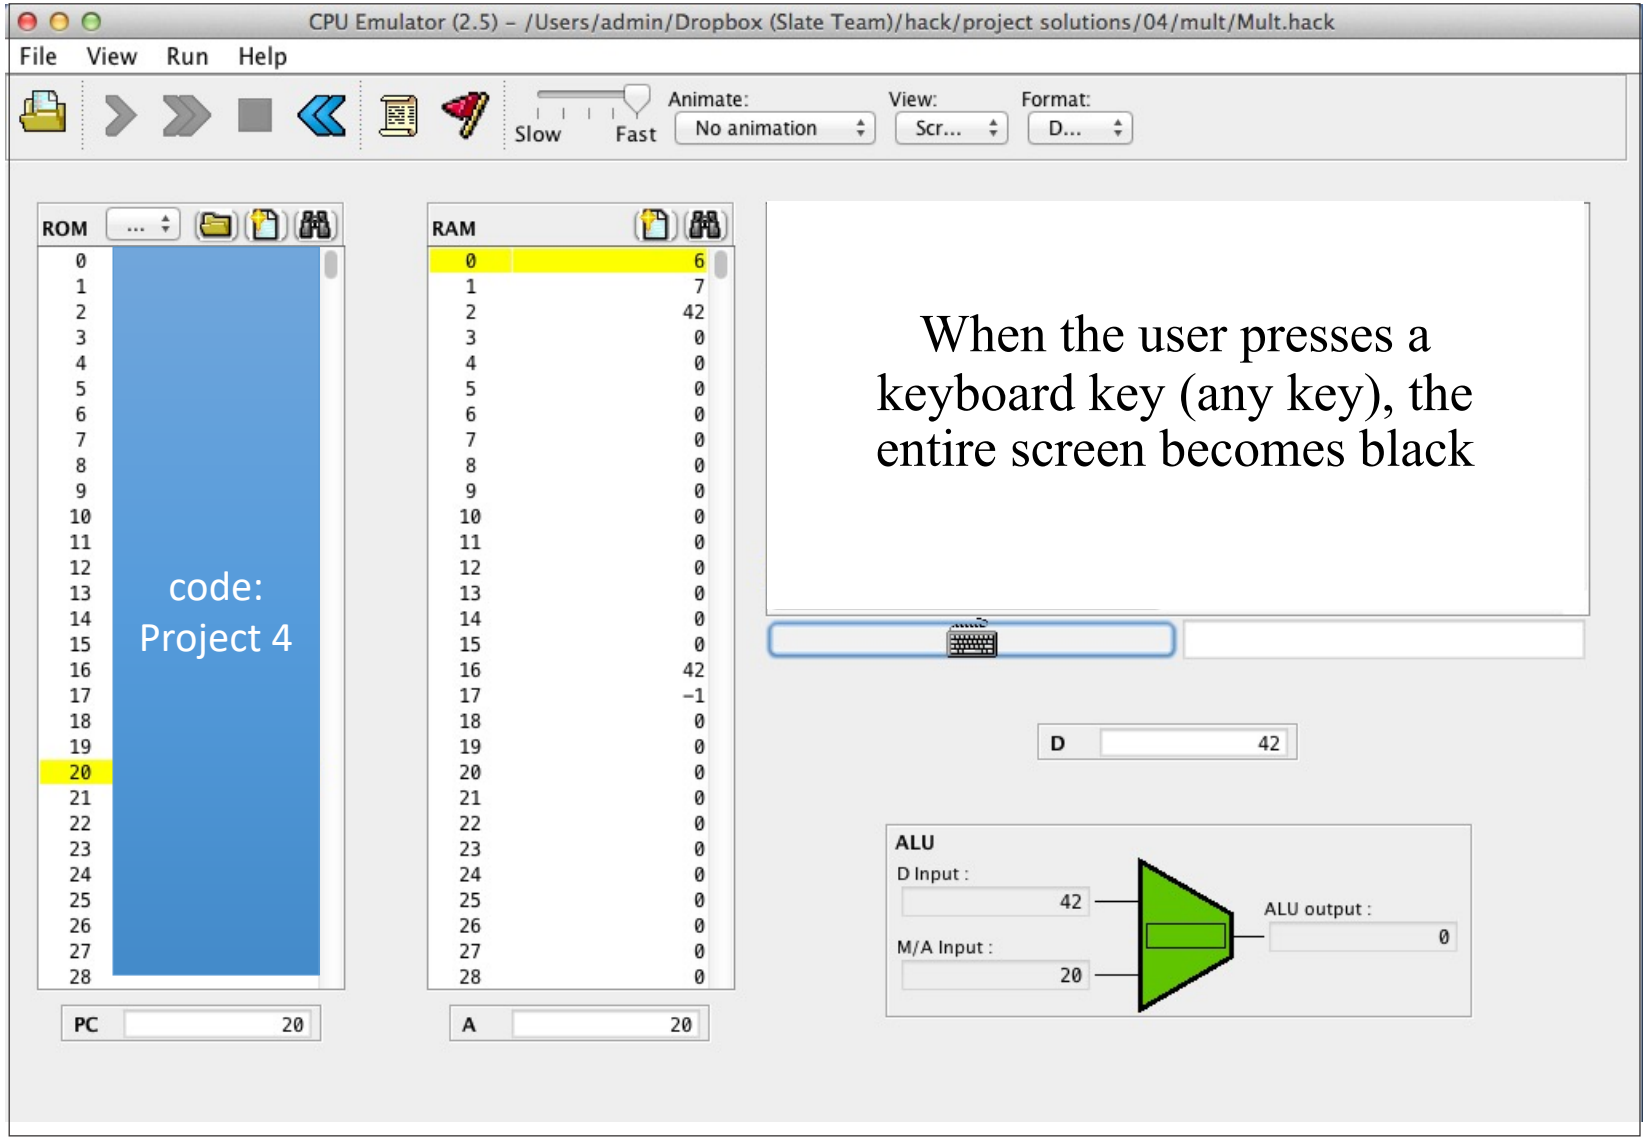
`Mult`: a program that computes `R2 = R0 * R1`



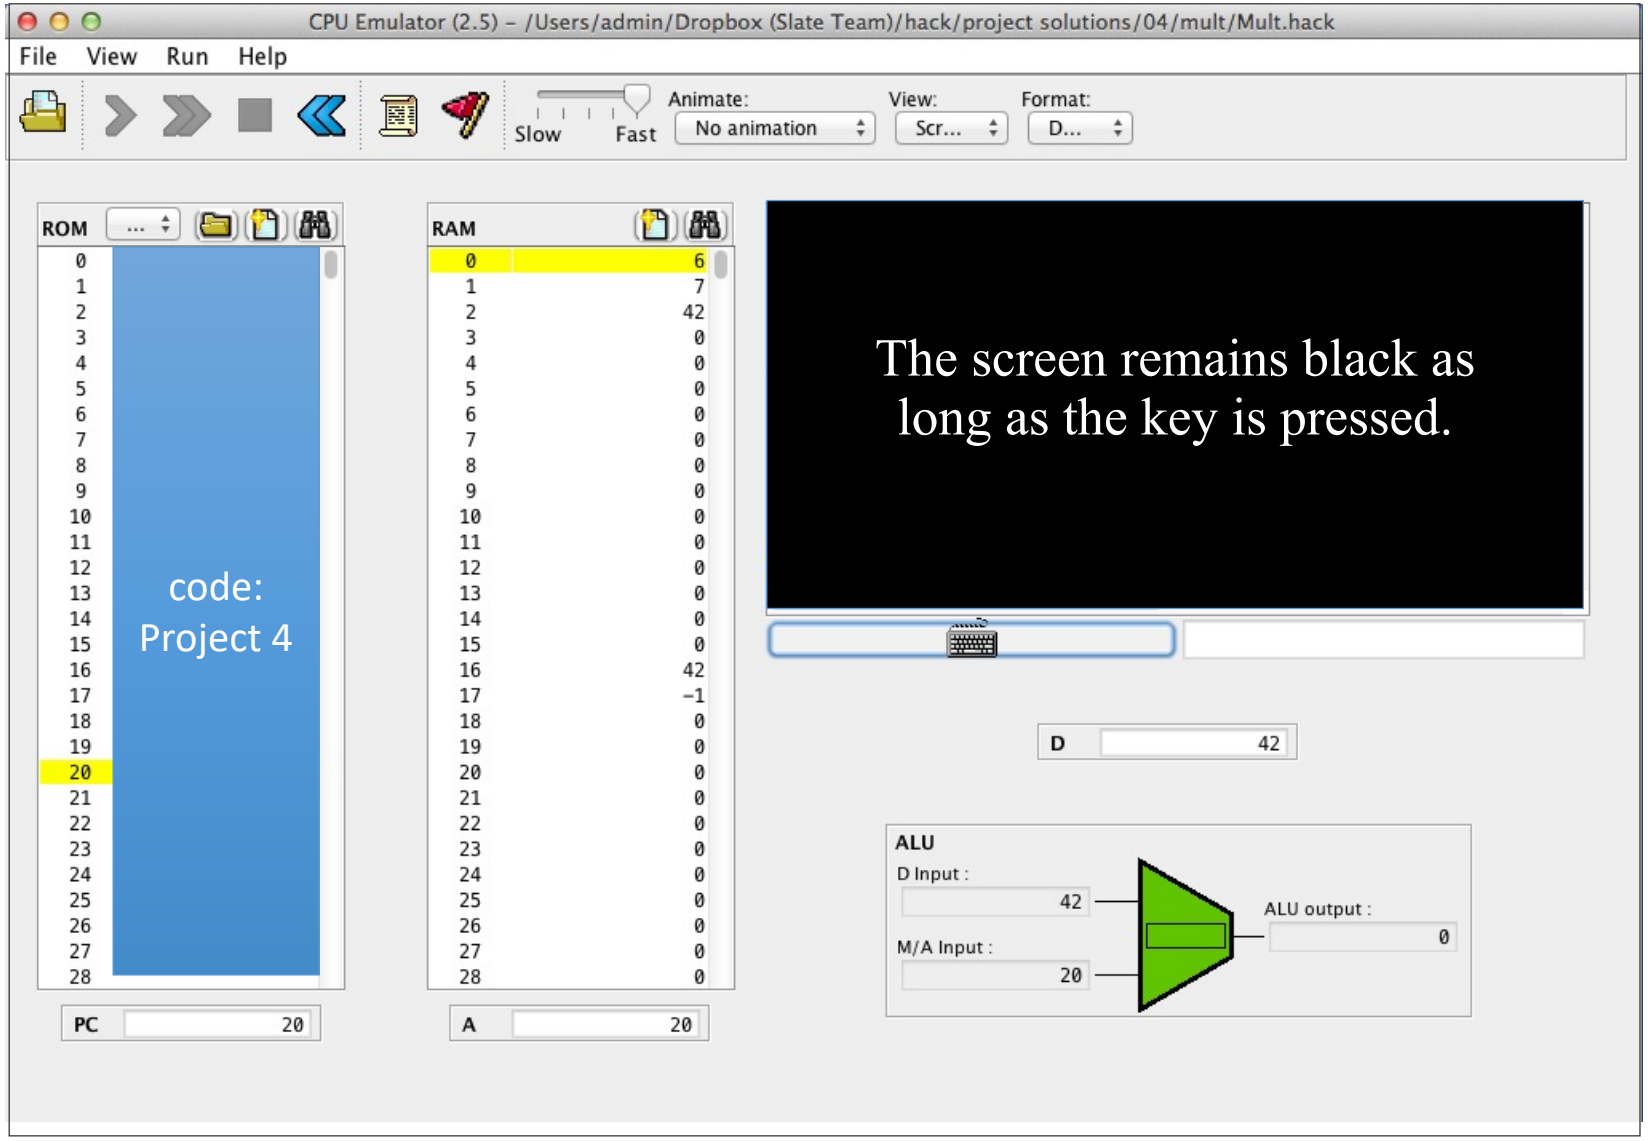
`Mult`: a program that computes `R2 = R0 * R1`



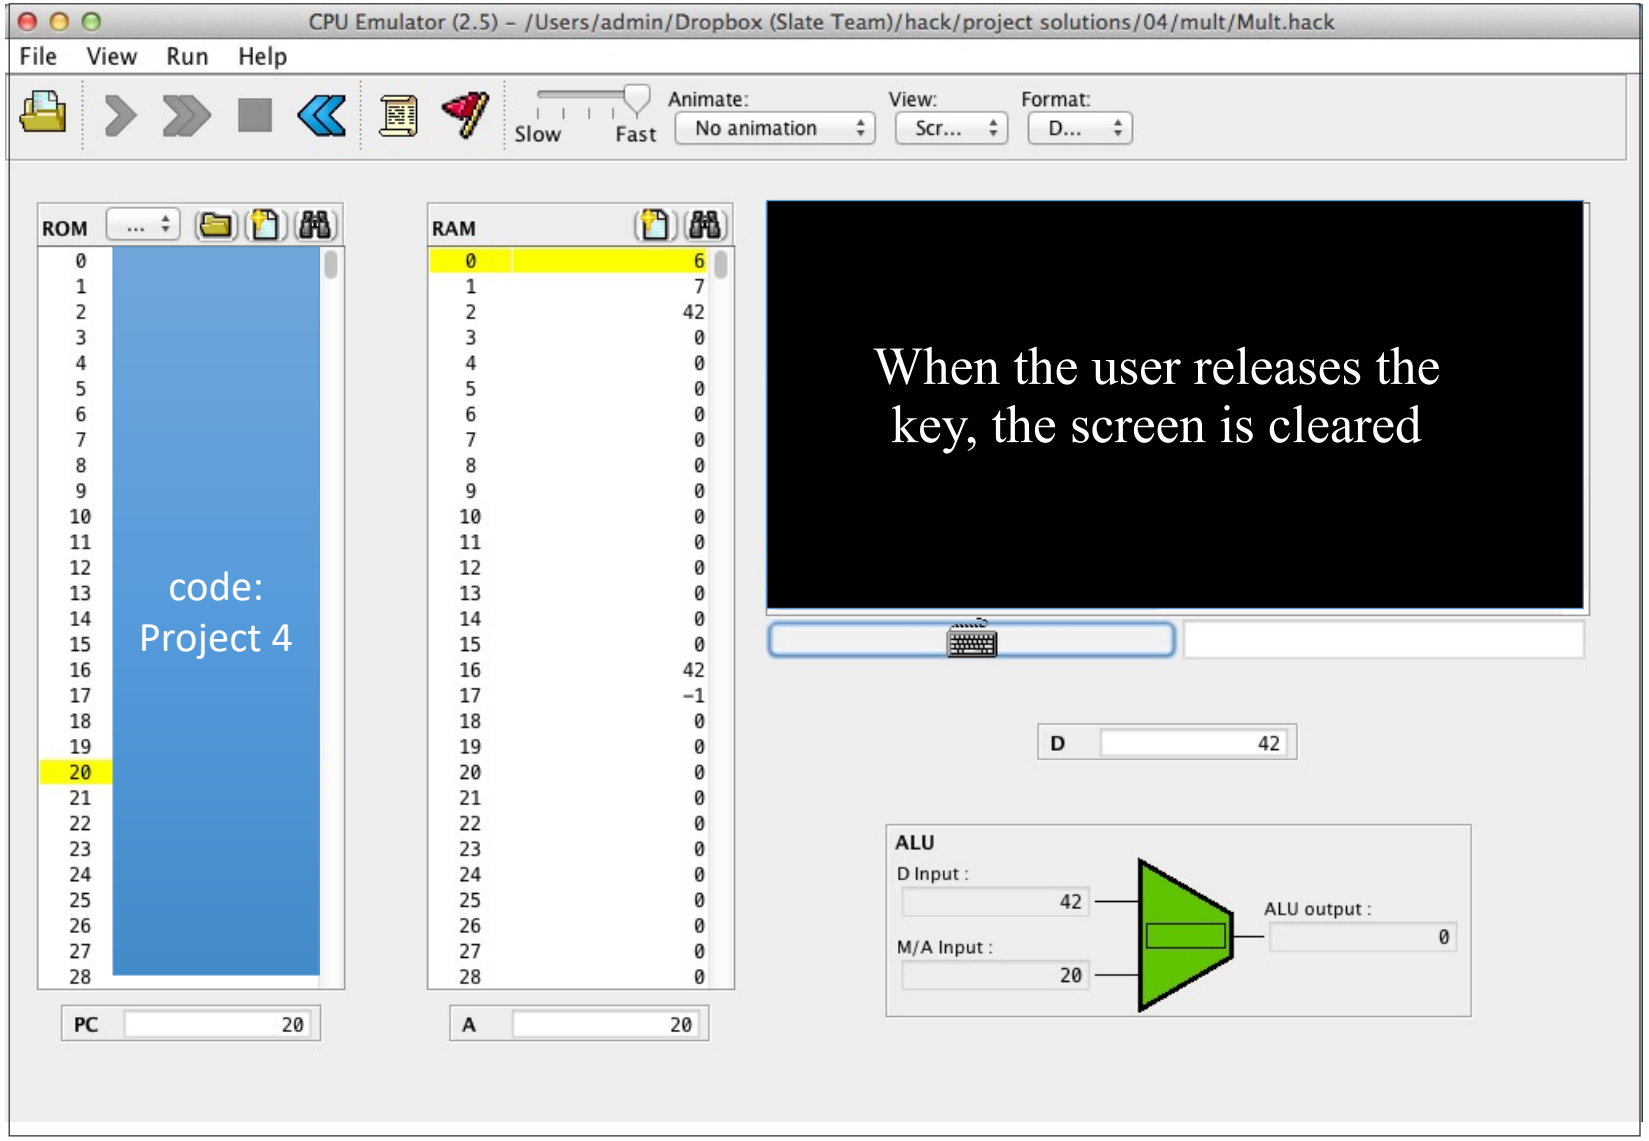
`Fill`: a simple interactive program



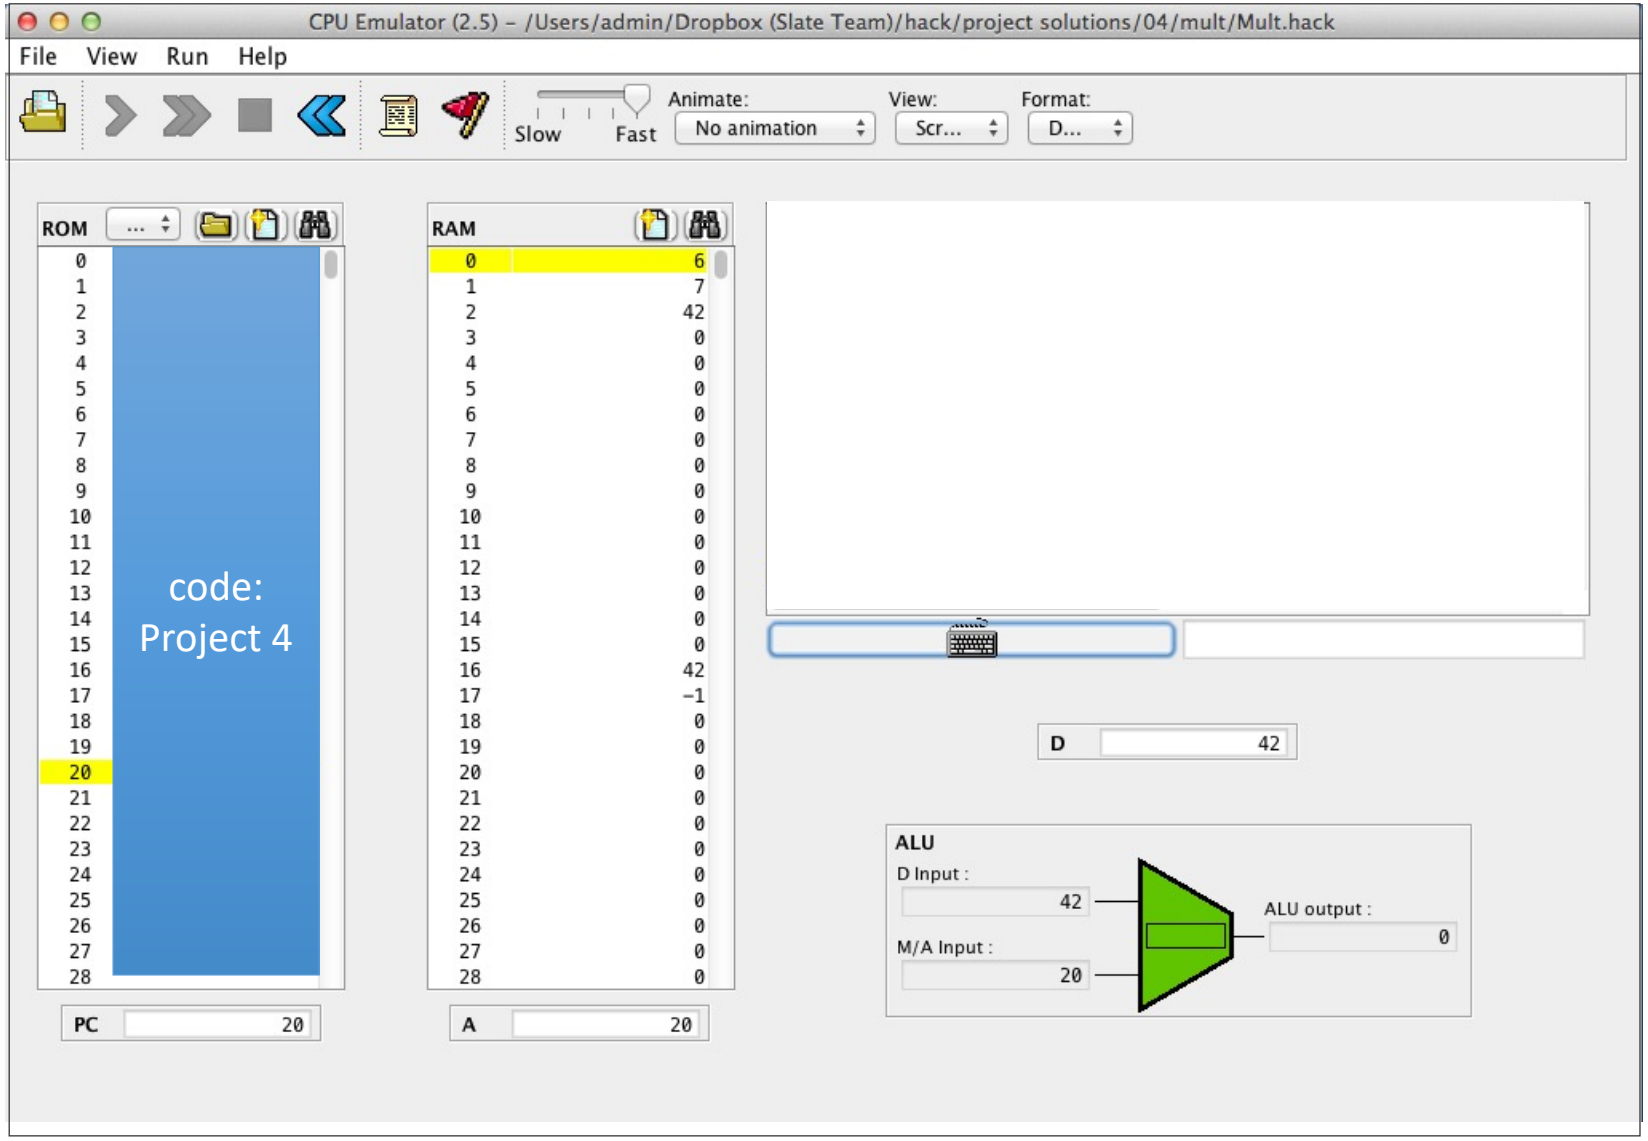
`Fill`: a simple interactive program



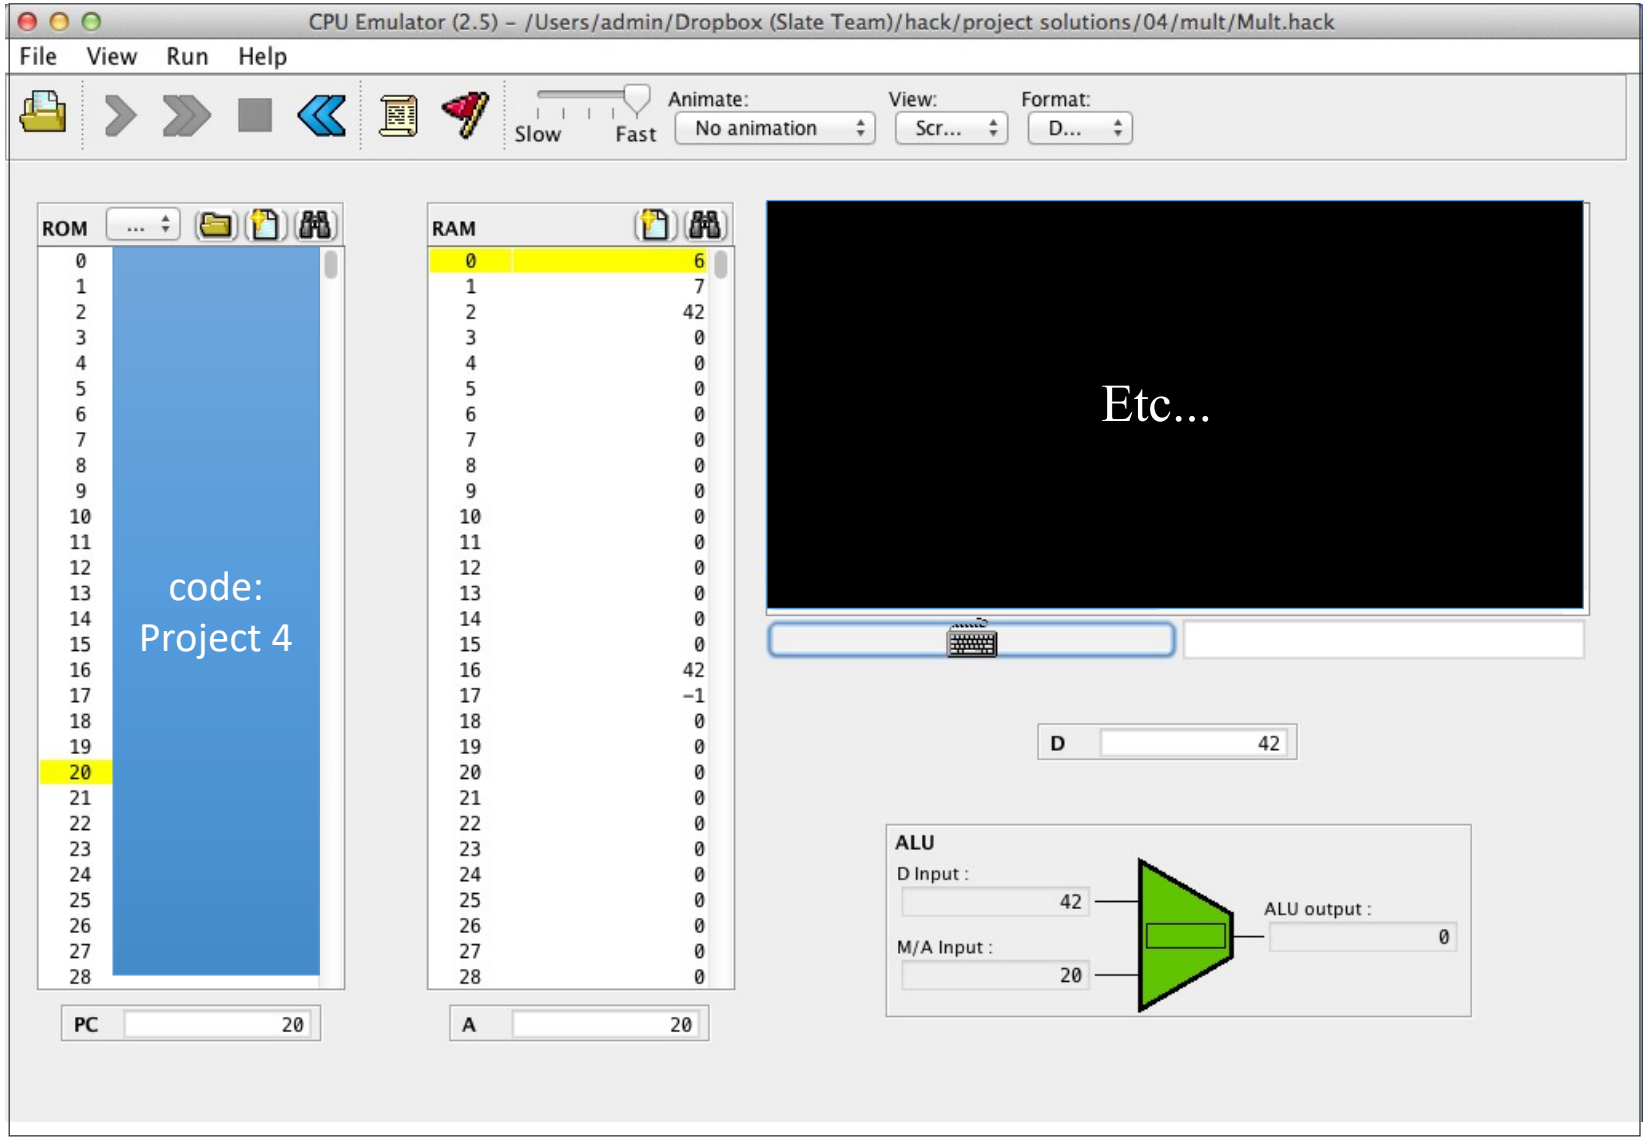
`Fill`: a simple interactive program



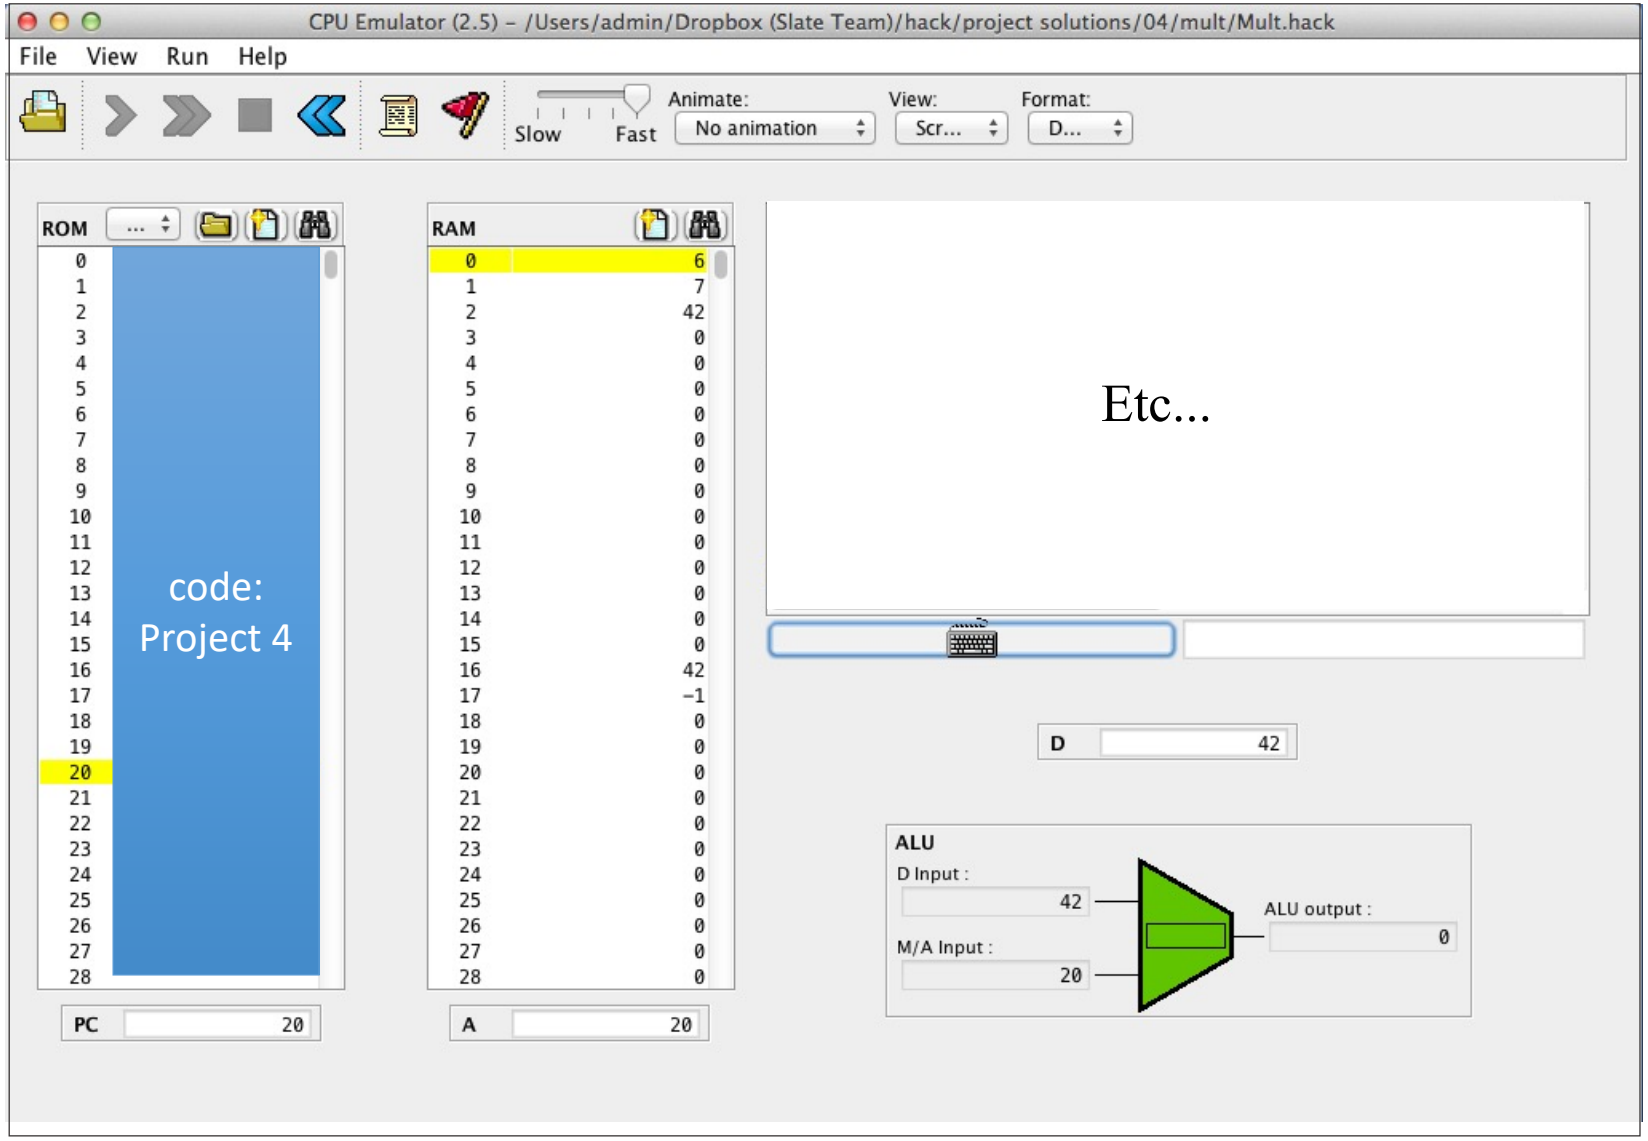
`Fill`: a simple interactive program



`Fill`: a simple interactive program



`Fill`: a simple interactive program



`Fill`: a simple interactive program

Algorithm

- Execute an infinite loop that listens to the keyboard input
- When a key is pressed (any key),
  execute code that writes "black" in every pixel
- When no key is pressed, execute code that writes "white" in every pixel

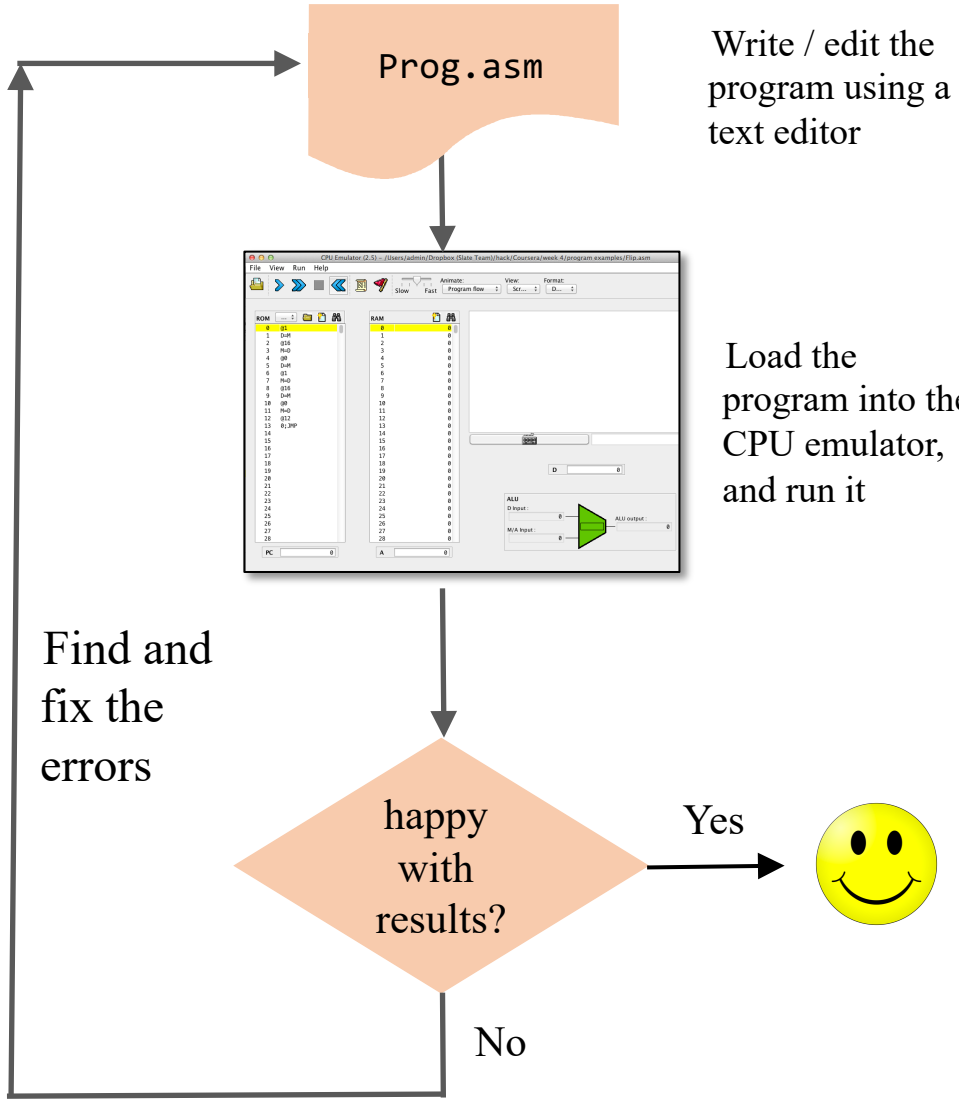
Tip: This program requires working with pointers.

Task 3: Define and write a program of your own

Any ideas?

It's your call!

Program development process



Translation options

1. Let the CPU emulator translate into binary code (as seen on the left)

2. Use the supplied assembler:

- Find it on your PC in `nand2tetris/tools`
- See the *Assembler Tutorial* in Project 6 (`www.nand2tetris.org`)

Implementation notes

Well-written low-level code is

- Compact
- Efficient
- Elegant
- Self-describing

Tips

- Use symbolic variables and labels
- Use sensible documentation
- Use sensible variable and label names
- Variables: lower-case
- Labels: upper-case
- Use indentation
- Start by writing pseudocode.
